Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Observe for clinical worsening, suicidality, or unusual behavior changes, especially during the initial few months of therapy or during dosage changes. If history of cardiac problems, monitor cardiac status closely. Be alert to the potential of new or increased seizure activity. Instruct family or caregiver to observe the patient's behavior closely and communicate any changes to prescriber. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsMonitor ECG/cardiac status in older adults and patients with cardiac disease

Patient EducationTake multiple dose medication with meals to reduce side effects. Take single daily dose at bedtime to reduce daytime sedation. The effect of this drug may take several weeks to appear. Do not use alcohol, caffeine, and other prescriptive or OTC medications without consulting prescriber. May cause weight gain, dizziness, drowsiness, headache, or seizures (use caution when driving or engaging in tasks that require alertness until response to drug is known); dry mouth or unpleasant aftertaste (sucking lozenges and frequent mouth care may help); constipation (increased exercise, fluids, fruit, or fiber may help); or orthostatic hypotension (use caution when rising from lying or sitting to standing position or when climbing stairs). Report unresolved constipation or GI upset, unusual muscle weakness, palpitations, or persistent CNS disturbances (hallucinations, suicidality, seizures, delirium, insomnia, or impaired gait). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 25 mg, 50 mg, 75 mg

Anafranil®: 25 mg, 50 mg, 75 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Anafranil)

50 mg (60): $375.95

Capsules (ClomiPRAMINE HCl)

25 mg (60): $27.99

50 mg (60): $33.99

75 mg (60): $38.99

Mechanism of ActionClomipramine appears to affect serotonin uptake while its active metabolite, desmethylclomipramine, affects norepinephrine uptake

Pharmacodynamics/Kinetics

Absorption: Rapid

Protein binding: 97%, primarily to albumin

Metabolism: Hepatic to desmethylclomipramine (DMI; active); extensive first-pass effect

Half-life elimination: Clomipramine: mean 32 hours (19-37 hours); DMI: mean 69 hours (range 54-77 hours)

Time to peak, plasma: 2-6 hours

Excretion: Urine and feces

Related Information

- Antidepressant Agents
- Antidepressant Receptor Profile
- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). Long-term treatment with TCAs, such as clomipramine, increases the risk of caries by reducing salivation and salivary buffer capacity.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine and levonordefrin have been shown to have an increased pressor response in combination with TCAs. Clomipramine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health CommentTricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal.

Seizures are dose dependent. The overall cumulative incidence is 0.7%. Doses ≤250 mg/day have an incidence of 0.5% and doses ≥300 mg/day have an incidence of 2.1%.

Index TermsClomipramine Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

ClonazePAM may be confused with clofazimine, cloNIDine, clorazepate, clozapine, LORazepam

Klonopin® may be confused with clofazimine, clonNIDine, clorazepate, clozapine, LORazepam

Pronunciation(kloe NA ze pam)
U.S. Brand NamesKlonopin®; Klonopin® Wafers
Canadian Brand NamesAlti-Clonazepam; Apo-Clonazepam®; Clonapam; CO Clonazepam; Gen-Clonazepam; Klonopin®; Novo-Clonazepam; Nu-Clonazepam; PMS-Clonazepam; Pro-Clonazepam; Rho®-Clonazepam; Rivotril®; Sandoz-Clonazepam
Pharmacologic CategoryBenzodiazepine
Use: Labeled IndicationsAlone or as an adjunct in the treatment of petit mal variant (Lennox-Gastaut), akinetic, and myoclonic seizures; petit mal (absence) seizures unresponsive to succimides; panic disorder with or without agoraphobia
Use: Unlabeled/InvestigationalRestless legs syndrome; neuralgia; multifocal tic disorder; parkinsonian dysarthria; bipolar disorder; adjunct therapy for schizophrenia
Use: DentalBurning mouth syndrome
Dosing: Adults

Seizure disorders: Oral:

Initial daily dose not to exceed 1.5 mg given in 3 divided doses; may increase by 0.5-1 mg every third day until seizures are controlled or adverse effects seen (maximum: 20 mg/day)

Usual maintenance dose: 0.05-0.2 mg/kg; do not exceed 20 mg/day

Panic disorder: Oral: 0.25 mg twice daily; increase in increments of 0.125-0.25 mg twice daily every 3 days; target dose: 1 mg/day (maximum: 4 mg/day)

Discontinuation of treatment: To discontinue, treatment should be withdrawn gradually. Decrease dose by 0.125 mg twice daily every 3 days until medication is completely withdrawn.

Dosing: ElderlyRefer to adult dosing. Initiate with low doses and observe closely.
Dosing: Pediatric

Seizure disorders (see Use): Oral:

Children <10 years or 30 kg:

Initial daily dose: 0.01-0.03 mg/kg/day (maximum: 0.05 mg/kg/day) given in 2-3 divided doses; increase by no more than 0.5 mg every third day until seizures are controlled or adverse effects seen.

Usual maintenance dose: 0.1-0.2 mg/kg/day divided 3 times/day; not to exceed 0.2 mg/kg/day.

Children >10 years or 30 kg: Refer to adult dosing.

Dosing: Renal ImpairmentHemodialysis: Supplemental dose is not necessary.
Administration: OralOrally-disintegrating tablet: Open pouch and peel back foil on the blister; do not push tablet through foil. Use dry hands to remove tablet and place in mouth. May be swallowed with or without water. Use immediately after removing from package.
Extemporaneously PreparedA 0.1 mg/mL oral suspension has been made using five 2 mg tablets, purified water USP (10 mL), and methylcellulose 1% (qs ad 100 mL). The expected stability of this preparation is 2 weeks if stored under refrigeration; shake well before use.

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 2nd ed, Cincinnati, OH: Harvey Whitney Books Co, 1992.

RestrictionsC-IV
ContraindicationsHypersensitivity to clonazepam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); significant liver disease; narrow-angle glaucoma; pregnancy
Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

- Valproic acid: Concurrent use with valproic acid may result in absence status.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.

- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.

- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties. Worsening of seizures may occur when added to patients with multiple seizure types. Monitoring of CBC and liver function tests has been recommended during prolonged therapy.

- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsHepatic clearance may be decreased allowing accumulation of active drug. Also, metabolites of clonazepam are renally excreted and may accumulate in the elderly as renal function declines with age. Observe for signs of CNS and pulmonary toxicity.

Pregnancy Risk FactorD

Pregnancy ConsiderationsClonazepam was shown to be teratogenic in some animal studies. Clonazepam crosses the placenta. Benzodiazepine use during pregnancy is associated with increased risk of congenital malformations. Nonteratogenic effects (including neonatal flaccidity, respiratory and feeding problems, and withdrawal symptoms) during the postnatal period have also been reported with benzodiazepine use. Epilepsy itself, number of medications, genetic factors, or a combination of these probably influence the teratogenicity of anticonvulsant therapy.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsClonazepam enters breast milk; clinical effects on the infant include CNS depression, respiratory depression reported (no recommendation from the AAP).

Adverse ReactionsReactions reported in patients with seizure and/or panic disorder. Frequency not defined.

Cardiovascular: Edema (ankle or facial), palpitation

Central nervous system: Amnesia, ataxia (seizure disorder ~30%; panic disorder 5%), behavior problems (seizure disorder ~25%), coma, confusion, depression, dizziness, drowsiness (seizure disorder ~50%), emotional lability, fatigue, fever, hallucinations, headache, hypotonia, hysteria, insomnia, intellectual ability reduced, memory disturbance, nervousness; paradoxical reactions (including aggressive behavior, agitation, anxiety, excitability, hostility, irritability, nervousness, nightmares, sleep disturbance, vivid dreams); psychosis, slurred speech, somnolence (panic disorder 37%), suicidal attempt, vertigo

Dermatologic: Hair loss, hirsutism, skin rash

Endocrine & metabolic: Dysmenorrhea, libido increased/decreased

Gastrointestinal: Abdominal pain, anorexia, appetite increased/decreased, coated tongue, constipation, dehydration, diarrhea, gastritis, gum soreness, nausea, weight changes (loss/gain), xerostomia

Genitourinary: Colpitis, dysuria, ejaculation delayed, enuresis, impotence, micturition frequency, nocturia, urinary retention, urinary tract infection

Hematologic: Anemia, eosinophilia, leukopenia, thrombocytopenia

Hepatic: Alkaline phosphatase increased (transient), hepatomegaly, transaminases increased (transient)

Neuromuscular & skeletal: Choreiform movements, coordination abnormal, dysarthria, muscle pain, muscle weakness, myalgia, tremor

Ocular: Blurred vision, eye movements abnormal, diplopia, nystagmus

Respiratory: Chest congestion, cough, bronchitis, hypersecretions, pharyngitis, respiratory depression, respiratory tract infection, rhinitis, rhinorrhea, shortness of breath, sinusitis

Miscellaneous: Allergic reaction, aphonia, dysdiadochokinesis, encopresis, “glassy-eyed” appearance, hemiparesis, lymphadenopathy

Metabolism/Transport Effects

Substrate of CYP3A4 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Clonazepam serum concentration is unlikely to be increased by grapefruit juice because of clonazepam's high oral bioavailability.

Herb/Nutraceutical: St John's wort may decrease clonazepam levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersCBC, liver function tests; observe patient for excess sedation, respiratory depression
Reference RangeRelationship between serum concentration and seizure control is not well established

Timing of serum samples: Peak serum levels occur 1-3 hours after oral ingestion; the half-life is 20-40 hours; therefore, steady-state occurs in 5-7 days

Therapeutic levels: 20-80 ng/mL; Toxic concentration: >80 ng/mL

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for signs of CNS depression. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient seizure precautions (if administered for seizures), appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsRenal function
Patient EducationTake exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help). If medication is used to control seizures, wear identification that you are taking an antiepileptic medication. Report excessive drowsiness, dizziness, fatigue, or impaired coordination; CNS changes (confusion, depression, increased sedation, excitation, headache, agitation, insomnia, or nightmares) or changes in cognition; respiratory difficulty or shortness of breath; changes in urinary pattern, changes in sexual activity; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances, excessive perspiration, or excessive GI symptoms (cramping, constipation, vomiting, anorexia); worsening of seizure activity, or loss of seizure control. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 0.5 mg, 1 mg, 2 mg

Klonopin®: 0.5 mg, 1 mg, 2 mg

Tablet, orally disintegrating: 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg

Klonopin® Wafers: 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablet, orally-disintegrating (Clonazepam ODT)

0.125 mg (60): $69.99

0.25 mg (60): $72.99

0.5 mg (60): $70.99

Tablets (Clonazepam)

0.5 mg (30): $13.99

1 mg (30): $11.99

2 mg (30): $12.99

Tablets (Klonopin)

0.5 mg (30): $49.44

1 mg (30): $50.54

2 mg (30): $65.93

Mechanism of ActionThe exact mechanism is unknown, but believed to be related to its ability to enhance the activity of GABA; suppresses the spike-and-wave discharge in absence seizures by depressing nerve transmission in the motor cortex
Pharmacodynamics/Kinetics

Onset of action: 20-60 minutes

Duration: Infants and young children: 6-8 hours; Adults: ≤12 hours

Absorption: Well absorbed

Distribution: Adults: V_d: 1.5-4.4 L/kg

Protein binding: 85%

Metabolism: Extensively hepatic via glucuronide and sulfate conjugation

Half-life elimination: Children: 22-33 hours; Adults: 19-50 hours

Time to peak, serum: 1-3 hours; Steady-state: 5-7 days

Excretion: Urine (<2% as unchanged drug); metabolites excreted as glucuronide or sulfate conjugates

Related Information

- Benzodiazepines
- CMS: Long-Term Care Facility Thresholds
- Discontinuation of Psychotropic Drugs
- Status Epilepticus
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsEthosuximide or valproic acid may be preferred for treatment of absence (petit mal) seizures. Clonazepam-induced behavioral disturbances may be more frequent in mentally handicapped patients. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms. Flumazenil, a competitive benzodiazepine antagonist at the CNS receptor site, reverses benzodiazepine-induced CNS depression.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), gum soreness, and coated tongue.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Clonazepam is a long half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Anesthesia and Critical Care Concerns/Other ConsiderationsFlumazenil, a competitive benzodiazepine antagonist at the CNS receptor site, reverses benzodiazepine-induced CNS depression. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Medication Safety Issues

Sound-alike/look-alike issues:

> Combipres® may be confused with Catapres®

Pronunciation(KLON i deen & klor THAL i done)
U.S. Brand NamesClorpres®; Combipres® [DSC]
Pharmacologic CategoryAlpha$_2$-Adrenergic Agonist; Diuretic, Thiazide
Use: Labeled IndicationsManagement of mild-to-moderate hypertension
Dosing: AdultsHypertension: Oral: 1 tablet 1-2 times/day
Dosing: ElderlyMay benefit from lower initial dose; see individual agents.
Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Pregnancy Risk FactorC
Pregnancy ConsiderationsRefer to Clonidine monograph.
Lactation

Clonidine: Enters breast milk/not recommended

Chlorthalidone: Enters breast milk/compatible

Adverse ReactionsSee individual agents.
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antidepressants (Alpha2-Antagonist): May diminish the hypotensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Iobenguane I 123: Alpha2-Agonists may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May enhance the adverse/toxic effect of CloNIDine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: May diminish the antihypertensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

0.1: Clonidine hydrochloride 0.1 mg and chlorthalidone 15 mg

0.2: Clonidine hydrochloride 0.2 mg and chlorthalidone 15 mg

0.3: Clonidine hydrochloride 0.3 mg and chlorthalidone 15 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Clorpres)

0.1-15 mg (60): $64.99

0.2-15 mg (60): $82.96

0.3-15 mg (60): $99.56

Pharmacodynamics/KineticsSee individual agents.
Related Information

- Chlorthalidone
- CloNIDine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Clonidine: Significant xerostomia (normal salivary flow resumes upon discontinuation), orthostatic hypotension, and abnormal taste.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDrowsiness is common
Mental Health: Effects on Psychiatric TreatmentDry mouth, orthostatic hypotension, and sedation may be increased with concurrent psychotropic use; TCAs may antagonize clonidine's hypotensive effect; rare reports of blood dyscrasias; use caution with clozapine and carbamazepine; thiazides decrease lithium clearance resulting in elevated serum lithium levels and potential toxicity; monitor serum lithium levels
Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for clonidine and chlorthalidone combination therapy may include improved compliance and synergistic reductions in blood pressure with an accomplished reduction in side effects. Thiazide therapy improves cardiovascular outcomes in patients with hypertension. See Cardiovascular Considerations for individual agents.

Special Alerts

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children’s Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

CloNIDine may be confused with Clomid®, clomiPHENE, clonazePAM, clozapine, Klonopin®, quiNIDine

Catapres® may be confused with Cataflam®, Cetapred®, Combipres®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (epidural administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(KLON i deen)
U.S. Brand NamesCatapres-TTS®; Catapres®; Duraclon®
Canadian Brand NamesApo-Clonidine®; Carapres®; Dixarit®; Novo-Clonidine; Nu-Clonidine
Pharmacologic CategoryAlpha$_2$-Adrenergic Agonist
Use: Labeled IndicationsManagement of mild-to-moderate hypertension; either used alone or in combination with other antihypertensives

Orphan drug: Duraclon®: For continuous epidural administration as adjunctive therapy with intraspinal opiates for treatment of cancer pain in patients tolerant to or unresponsive to intraspinal opiates

Use: Unlabeled/InvestigationalHeroin or nicotine withdrawal; severe pain; dysmenorrhea; vasomotor symptoms associated with menopause; ethanol dependence; prophylaxis of migraines; glaucoma; diabetes-associated diarrhea; impulse control disorder, attention-deficit/hyperactivity disorder (ADHD), clozapine-induced sialorrhea
Dosing: Adults

Acute hypertension (urgency): Oral: Initial 0.1-0.2 mg; may be followed by additional doses of 0.1 mg every hour, if necessary, to a maximum total dose of 0.6 mg

Unlabeled route of administration: Sublingual clonidine 0.1-0.2 mg twice daily may be effective in patients unable to take oral medication

Hypertension:

Oral: Initial dose: 0.1 mg twice daily (maximum recommended dose: 2.4 mg/day); usual dose range (JNC 7): 0.1-0.8 mg/day in 2 divided doses

Transdermal: Apply once every 7 days; for initial therapy start with 0.1 mg and increase by 0.1 mg at 1- to 2-week intervals (dosages >0.6 mg do not improve efficacy); usual dose range (JNC 7): 0.1-0.3 mg once weekly

Note: If transitioning from oral to transdermal, overlap oral for 1-2 days. Transdermal route takes 2-3 days to achieve therapeutic effects.

Conversion from oral to transdermal:

Day 1: Place Catapres-TTS® 1; administer 100% of oral dose.

Day 2: Administer 50% of oral dose.

Day 3: Administer 25% of oral dose.

Day 4: Patch remains, no further oral supplement necessary.

Nicotine withdrawal symptoms: 0.1 mg twice daily to maximum of 0.4 mg/day for 3-4 weeks

Pain management: Epidural infusion: Starting dose: 30 mcg/hour; titrate as required for relief of pain or presence of side effects; minimal experience with doses >40 mcg/hour; should be considered an adjunct to intraspinal opiate therapy

Dosing: ElderlyOral: Initial: 0.1 mg once daily at bedtime, increase gradually as needed.
Dosing: Pediatric

Hypertension: Oral: Children ≥12 years: Initial: 0.2 mg/day in 2 divided doses; increase gradually at 5- to 7-day intervals; maximum: 2.4 mg/day

Clonidine tolerance test (growth hormone release from pituitary): Oral: 0.15 mg/m^2 or 4 mcg/kg as single dose

ADHD (unlabeled use): Oral: Initial: 0.05 mg/day, increase every 3-7 days by 0.05 mg/day to 3-5 mcg/kg/day given in divided doses 3-4 times/day; maximum dose: 0.3-0.4 mg/day

Pain management: Epidural infusion: Reserved for patients with severe intractable pain, unresponsive to other analgesics or epidural or spinal opiates: Initial: 0.5 mcg/kg/hour; adjust with caution, based on clinical effect

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute: Administer 50% to 75% of normal dose initially.

Not dialyzable (0% to 5%) via hemo- or peritoneal dialysis; supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V. DetailpH: 5-7

Administration: OralDo not discontinue clonidine abruptly. If needed, gradually reduce dose over 2-4 days to avoid rebound hypertension.

Administration: TopicalTransdermal patches should be applied weekly at bedtime to a clean, hairless area of the upper outer arm or chest. Rotate patch sites weekly. Redness under patch may be reduced if a topical corticosteroid spray is applied to the area before placement of the patch.

Dietary ConsiderationsHypertensive patients may need to decrease sodium and calories in diet.

Compatibility

Y-site administration: Compatible: Lorazepam.

Compatibility in syringe: Compatible: Bupivacaine with morphine, fentanyl with lidocaine, ketamine with tetracaine.

ContraindicationsHypersensitivity to clonidine hydrochloride or any component of the formulation

Allergy Considerations

- CloNIDine Allergy

Warnings/Precautions

Boxed warnings:

- Epidural use: See "Dosage form specific issues" below.

Concerns related to adverse effects:

- CNS depression: May cause significant CNS depression; use with caution in patients with pre-existing CNS disease or depression.
- Xerostomia: May cause significant xerostomia.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe coronary insufficiency, including recent MI and conduction disturbances, including sinus node dysfunction.
- Cerebrovascular disease: Use with caution in patients with cerebrovascular disease.
- Renal impairment: Use with caution in patients with chronic renal impairment.

Special populations:

- Elderly: Use with caution in the elderly; may be at greater risk for CNS depressive effects, favoring other agents in this population.
- Surgical patients: Discontinue within 4 hours of surgery then restart as soon as possible after.

Dosage form specific issues:

- Epidural use: **[U.S. Boxed Warning]: Epidural clonidine is not recommended for perioperative, obstetrical, or postpartum pain.** It is not recommended for use in patients with severe cardiovascular disease or hemodynamic instability. In all cases, the epidural route may lead to cardiovascular instability (hypotension, bradycardia). Should be administered via a continuous epidural infusion device.
- Transdermal patch: May contain conducting metal (eg, aluminum); remove patch prior to MRI. Due to the potential for altered electrical conductivity, remove transdermal patch before cardioversion or defibrillation.

Other warnings/precautions:

- Discontinuation of therapy: Gradual withdrawal is needed (over 1 week for oral, 2-4 days with epidural) if drug needs to be stopped. Patients should be instructed about abrupt discontinuation (causes rapid increase in BP and symptoms of sympathetic overactivity). In patients on both a beta-blocker and clonidine where withdrawal of clonidine is necessary, withdraw the beta-blocker first and several days before clonidine. Then slowly decrease clonidine.

Geriatric ConsiderationsBecause of its potential CNS adverse effects, clonidine may not be considered a drug of choice in the elderly. If the decision is to use clonidine, adjust dose based on response and adverse reactions.

Pregnancy Risk FactorC

Pregnancy ConsiderationsClonidine crosses the placenta. Caution should be used with this drug due to the potential of rebound hypertension with abrupt discontinuation.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsEnters breast milk; AAP has NO RECOMMENDATION.

Adverse ReactionsIncidence of adverse events is not always reported.

>10%:

Central nervous system: Drowsiness (35% oral, 12% transdermal), dizziness (16% oral, 2% transdermal)

Dermatologic: Transient localized skin reactions characterized by pruritus, and erythema (15% to 50% transdermal)

Gastrointestinal: Dry mouth (40% oral, 25% transdermal)

1% to 10%:

Cardiovascular: Orthostatic hypotension (3% oral)

Central nervous system: Headache (1% oral, 5% transdermal), sedation (3% transdermal), fatigue (6% transdermal), lethargy (3% transdermal), insomnia (2% transdermal), nervousness (3% oral, 1% transdermal), mental depression (1% oral)

Dermatologic: Rash (1% oral), allergic contact sensitivity (5% transdermal), localized vesiculation (7%), hyperpigmentation (5% at application site), edema (3%), excoriation (3%), burning (3%), throbbing, blanching (1%), papules (1%), and generalized macular rash (1%) has occurred in patients receiving transdermal clonidine.

Endocrine & metabolic: Sodium and water retention, sexual dysfunction (3% oral, 2% transdermal), impotence (3% oral, 2% transdermal)

Gastrointestinal: Nausea (5% oral, 1% transdermal), vomiting (5% oral), anorexia and malaise (1% oral), constipation (10% oral, 1% transdermal), dry throat (2% transdermal), taste disturbance (1% transdermal), weight gain (1% oral)

Genitourinary: Nocturia (1% oral)

Hepatic: Liver function test (mild abnormalities, 1% oral)

Neuromuscular & skeletal: Weakness (10% transdermal)

Miscellaneous: Withdrawal syndrome (1% oral)

<1% (Limited to important or life-threatening): Hepatitis (oral), difficulty in micturition (oral, transdermal), urinary retention (oral), hives (oral, transdermal), angioedema (oral, transdermal), urticaria (oral, transdermal), alopecia (oral, transdermal), parotid pain (oral), gynecomastia (oral, transdermal), transient elevation of blood glucose (oral), elevation of creatinine phosphokinase (oral), palpitation (oral, transdermal), tachycardia (oral, transdermal), bradycardia (oral), sinus bradycardia (oral, transdermal), atrioventricular block (oral, transdermal), CHF (oral, transdermal), ECG abnormalities (oral, transdermal), flushing, pallor, Raynaud's phenomenon (oral, transdermal), chest pain (transdermal), blood pressure increase (transdermal), weakness, muscle or joint pain (0.6% oral), leg cramps (0.3% oral), fever (oral, transdermal), malaise (transdermal), withdrawal syndrome (transdermal), vivid dreams (oral, transdermal), nightmares (oral, transdermal), insomnia (oral), behavioral changes (transdermal), restlessness (oral, transdermal), anxiety (oral, transdermal), mental depression (transdermal), visual and auditory hallucinations (oral, transdermal), delirium (transdermal), CVA (transdermal), irritability (transdermal), weight gain (transdermal), rash (transdermal), orthostatic symptoms (transdermal), syncope (oral, transdermal), agitation (transdermal), contact dermatitis (transdermal), localized hypo- or hyperpigmentation (transdermal), anorexia (transdermal), vomiting (transdermal), loss of libido (transdermal), sexual activity decreased (transdermal), blurred vision (transdermal), burning of eyes (transdermal), dryness of eyes (transdermal), weakly positive Coombs' test (oral), ethanol sensitivity increased (oral), thrombocytopenia (oral), abdominal pain (oral), pseudo-obstruction (oral)

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antidepressants (Alpha2-Antagonist): May diminish the hypotensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Iobenguane I 123: Alpha2-Agonists may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Methylphenidate: May enhance the adverse/toxic effect of CloNIDine. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: May diminish the antihypertensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersBlood pressure, standing and sitting/supine, mental status, heart rate

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure (when started and weaned), and consider obtaining ECG prior to initiation (Vetter, 2008).

Reference RangeTherapeutic: 1-2 ng/mL (SI: 4.4-8.7 nmol/L)

Nursing: Physical Assessment/MonitoringUse with caution and monitor closely in presence of pre-existing renal impairment, cardiovascular disease, hemodynamic instability, CNS disease or depression. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, potential for additive hypotension, bradycardia, CNS depression). Monitor blood pressure and mental status, therapeutic effectiveness (according to purpose for use), and adverse response regularly during therapy. Pediatric patients being treated for ADHD should be screened/monitored for cardiovascular risk prior to and during use. Advise patients using oral hypoglycemic agents or insulin to check glucose levels closely; clonidine may decrease the symptoms of hypoglycemia. When discontinuing, monitor blood pressure and taper dose gradually (over 1 week for oral, 2-4 days for epidural). Teach patient proper use (eg, do not discontinue abruptly), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsECG; liver function tests

Patient EducationDo not take any new prescription or over-the-counter medications, or herbal products (especially cough or cold remedies and sleep or stay-awake medications that might affect blood pressure) during treatment unless approved by prescriber. Take as directed, at bedtime. If using patch, check daily for correct placement; rotate patch sites weekly. Do not skip doses or discontinue without consulting prescriber (this drug must be discontinued on a specific schedule to prevent serious adverse effects). This medication may cause drowsiness, dizziness, fatigue, insomnia (use caution when driving or engaging in tasks that require alertness until response is known); decreased libido or sexual function (will resolve when drug is discontinued); postural hypotension (use caution when rising from sitting or lying position or when climbing stairs); constipation (increased exercise, fluids, fruit, and dietary fiber may help); or dry mouth or nausea (frequent mouth care or sucking lozenges may help). Report changes in urinary pattern; persistent nervousness, depression, lethargy, insomnia or nightmares; sudden weight gain (weigh yourself in the same clothes at the same time of day once a week); unusual or persistent swelling of ankles, feet, or extremities; skin reaction to transdermal patch; or other persistent side effects. **Pregnancy precautions:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride [epidural; preservative free]:

Duraclon®: 100 mcg/mL (10 mL); 500 mcg/mL (10 mL)

Tablet, as hydrochloride: 0.1 mg, 0.2 mg, 0.3 mg

Catapres®: 0.1 mg, 0.2 mg, 0.3 mg

Transdermal system, topical [once-weekly patch]:

Catapres-TTS®-1: 0.1 mg/24 hours (4s)

Catapres-TTS®-2: 0.2 mg/24 hours (4s)

Catapres-TTS®-3: 0.3 mg/24 hours (4s)

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Patch weekly (Catapres-TTS-1)

0.1 mg/24 hrs (4): $93.73

Patch weekly (Catapres-TTS-2)

0.2 mg/24 hrs (4): $152.57

Patch weekly (Catapres-TTS-3)

0.3 mg/24 hrs (4): $212.52

Tablets (Catapres)

0.1 mg (60): $74.99

0.2 mg (60): $109.99

0.3 mg (60): $134.99

Tablets (Clonidine HCl)

0.1 mg (100): $23.32

0.2 mg (100): $22.21

0.3 mg (100): $16.08

Mechanism of ActionStimulates alpha$_2$-adrenoceptors in the brain stem, thus activating an inhibitory neuron, resulting in reduced sympathetic outflow from the CNS, producing a decrease in peripheral resistance, renal vascular resistance, heart rate, and blood pressure; epidural clonidine may produce pain relief at spinal presynaptic and postjunctional alpha$_2$-adrenoceptors by preventing pain signal transmission; pain relief occurs only for the body regions innervated by the spinal segments where analgesic concentrations of clonidine exist

Pharmacodynamics/Kinetics

Onset of action: Oral: 0.5-1 hour; Transdermal: Initial application: 2-3 days

Duration: 6-10 hours

Distribution: V_d: Adults: 2.1 L/kg; highly lipid soluble; distributes readily into extravascular sites

Protein binding: 20% to 40%

Metabolism: Extensively hepatic to inactive metabolites; undergoes enterohepatic recirculation

Bioavailability: 75% to 95%

Half-life elimination: Adults: Normal renal function: 6-20 hours; Renal impairment: 18-41 hours

Time to peak: 2-4 hours

Excretion: Urine (65%, 32% as unchanged drug); feces (22%)

Related Information

- Addiction Treatments
- Depression
- Hypertension

Pharmacotherapy PearlsTransdermal clonidine should only be used in patients unable to take oral medication. The transdermal product is much more expensive than oral clonidine and produces no better therapeutic effects.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation), orthostatic hypotension, and abnormal taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common

Mental Health: Effects on Psychiatric TreatmentDry mouth, orthostatic hypotension, and sedation may be increased with concurrent psychotropic use; used to treat clozapine-induced sialorrhea (unlabeled use); TCAs may antagonize clonidine's hypotensive effect

Cardiovascular ConsiderationsTolerance to the blood pressure lowering effects of clonidine may develop with long-term therapy. Abrupt withdrawal from clonidine therapy should be very specifically avoided. The clonidine withdrawal syndrome is more pronounced after abrupt cessation of long-term therapy than after short-term therapy (1-2 months). It has usually been associated with previous administration of high oral doses (>1.2 mg daily) and/or continuation of beta-blocker therapy. The danger of abrupt discontinuation may be increased in patients with hypertension and/or other cardiovascular considerations. Blood pressure may increase 8-24 hours after last dose, but has occurred 60 hours after the last clonidine dose. Rebound hypertension has occurred with discontinuation of transdermal and epidural clonidine.

The advent of the clonidine patch has provided an important alternative to frequent daily dosing. However, it is important that overlap of therapy be maintained for 2-3 days when switching from oral medications to the patch. Important side effects of clonidine include drowsiness. It has also been suggested that clonidine may be useful in promoting smoking cessation.

Note that the use of moxonidine to lower sympathetic activation in patients with heart failure was associated with increased mortality.

Anesthesia and Critical Care Concerns/Other ConsiderationsAbrupt withdrawal from clonidine therapy should be avoided. Clonidine patch has provided an important alternative to frequent daily dosing; may be used in patients unable to take oral medication. Transdermal therapy takes 2-3 days for therapeutic effects.

Index TermsClonidine Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Plavix® may be confused with Elavil®, Paxil®

Pronunciation(kloh PID oh grel)

U.S. Brand NamesPlavix®

Canadian Brand NamesPlavix®

Pharmacologic CategoryAntiplatelet Agent

Use: Labeled IndicationsReduces rate of atherothrombotic events (myocardial infarction, stroke, vascular deaths) in patients with recent MI or stroke, or established peripheral arterial disease; reduces rate of atherothrombotic events in patients with unstable angina or non-ST-segment elevation acute coronary syndromes (unstable angina and non-ST-segment elevation MI) managed medically or through percutaneous coronary intervention (PCI) (with or without stent) or CABG; reduces rate of death and atherothrombotic events in patients with ST-segment elevation MI (STEMI) managed medically

Use: Unlabeled/InvestigationalIn aspirin-allergic patients, initial treatment of acute coronary syndromes (ACS) or prevention of coronary artery bypass graft closure (saphenous vein)

Dosing: Adults

Recent MI, recent stroke, or established arterial disease: Oral: 75 mg once daily

Acute coronary syndrome:

Unstable angina, non-ST-segment elevation myocardial infarction (UA/NSTEMI): Initial: 300 mg loading dose, followed by 75 mg once daily (in combination with aspirin 75-325 mg once daily). **Note:** A loading dose of 600 mg given at least 2 hours (or 24 hours in patients unable to take aspirin) prior to PCI is recommended (*Chest* guidelines, 2008)

ST-segment elevation myocardial infarction (STEMI): 75 mg once daily (in combination with aspirin 75-162 mg/day). CLARITY used a 300 mg loading dose of clopidogrel (with thrombolysis). The duration of therapy was <28 days (usually until hospital discharge) (Sabatine, 2005).

The American College of Chest Physicians (Goodman, 2008) recommends:

Patients ≤75 years: Initial: 300 mg loading dose, followed by 75 mg once daily for up to 28 days (in combination with aspirin)

Patients >75 years: 75 mg once daily for up to 28 days (with or without thrombolysis)

Note:*Coronary artery stents:* Duration of clopidogrel (in combination with aspirin): According to the ACC/AHA/SCAI guidelines, ideally 12 months following drug-eluting stent (DES) placement in patients not at high risk for bleeding; at a minimum, 1, 3, and 6 months for bare metal (BMS), sirolimus eluting, and paclitaxel eluting stents, respectively, for uninterrupted therapy (Smith, 2005). The 2008 *Chest* guidelines recommend for patients who undergo PCI and receive a BMS (with ongoing ACS) or a DES (with or without ongoing ACS) that clopidogrel be continued for at least 12 months. In patients receiving a BMS without ongoing ACS, clopidogrel may be continued for at least 1 month. In patients receiving a DES, therapy with clopidogrel beyond 12 months may be considered in patients without bleeding or tolerability issues (Becker, 2008). Premature interruption of therapy may result in stent thrombosis with subsequent fatal and nonfatal myocardial infarction.

Prevention of coronary artery bypass graft closure (saphenous vein): Aspirin-allergic patients (unlabeled use) [*Chest* guidelines, 2008]: Loading dose: 300 mg 6 hours following procedure; maintenance: 75 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentNo specific guidelines for patients with hepatic impairment; use with caution.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to clopidogrel or any component of the formulation; active pathological bleeding such as peptic ulcer disease (PUD) or intracranial hemorrhage; coagulation disorders

Allergy Considerations

- Thienopyridine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Thrombotic thrombocytopenic purpura (TTP): Cases of thrombotic thrombocytopenic purpura (usually occurring within the first 2 weeks of therapy), resulting in some fatalities, have been reported; urgent plasmapheresis is required.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with platelet disorders, bleeding disorders and/or at increased risk for bleeding (eg, PUD, trauma, or surgery).
- Hepatic impairment: Use with caution in patients with severe hepatic impairment (experience is limited).
- Renal impairment: Use with caution in patients with severe renal impairment (experience is limited).

Concurrent drug therapy issues:

- Anticoagulants and platelet aggregation inhibitors: Use with caution in patients receiving either anticoagulants (eg, heparin, warfarin) or other platelet aggregation inhibitors; bleeding risk is increased.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Coronary artery stents: In patients who have received bare-metal or drug-eluting stents (sirolimus or paclitaxel), interruption of antiplatelet therapy may result in stent thrombosis with subsequent fatal and nonfatal myocardial infarction. Ideally, 12 months following drug-eluting stent placement in patients not at high risk for bleeding is preferred; minimum durations of therapy are 1 month, 3 months, and 6 months for bare metal stents, sirolimus-eluting stents (Cypher®), and paclitaxel-eluting stents (Taxus®), respectively.
- Elective surgery: Consider discontinuing 5 days before elective surgery (except in patients with cardiac stents that have not completed their full course of dual antiplatelet therapy; patient-specific situations need to be discussed with cardiologist; AHA/ACC/SCAI/ACS/ADA Science Advisory provides recommendations).

Geriatric ConsiderationsPlasma concentrations of the main metabolite of clopidogrel were significantly higher in the elderly (≥75 years). This was not associated with changes in bleeding time or platelet aggregation. No dosage adjustment is recommended.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsAs with all drugs which may affect hemostasis, bleeding is associated with clopidogrel. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the concurrent use of multiple agents which alter hemostasis and patient susceptibility.

>10%: Gastrointestinal: The overall incidence of gastrointestinal events (including abdominal pain, vomiting, dyspepsia, gastritis, and constipation) has been documented to be 27% compared to 30% in patients receiving aspirin.

3% to 10%:

Cardiovascular: Chest pain (8%), edema (4%), hypertension (4%)

Central nervous system: Headache (3% to 8%), dizziness (2% to 6%), depression (4%), fatigue (3%), general pain (6%)

Dermatologic: Rash (4%), pruritus (3%)

Endocrine & metabolic: Hypercholesterolemia (4%)

Gastrointestinal: Abdominal pain (2% to 6%), dyspepsia (2% to 5%), diarrhea (2% to 5%), nausea (3%)

Genitourinary: Urinary tract infection (3%)

Hematologic: Bleeding (major 4%; minor 5%), purpura (5%), epistaxis (3%)

Hepatic: Liver function test abnormalities (<3%; discontinued in 0.11%)

Neuromuscular & skeletal: Arthralgia (6%), back pain (6%)

Respiratory: Dyspnea (5%), rhinitis (4%), bronchitis (4%), cough (3%), upper respiratory infection (9%)

Miscellaneous: Flu-like syndrome (8%)

1% to 3%:

Cardiovascular: Atrial fibrillation, cardiac failure, palpitation, syncope

Central nervous system: Fever, insomnia, vertigo, anxiety

Dermatologic: Eczema

Endocrine & metabolic: Gout, hyperuricemia

Gastrointestinal: Constipation, GI hemorrhage, vomiting

Genitourinary: Cystitis

Hematologic: Hematoma, anemia

Neuromuscular & skeletal: Arthritis, leg cramps, neuralgia, paresthesia, weakness

Ocular: Cataract, conjunctivitis

<1% (Limited to important or life-threatening): Agranulocytosis, allergic reaction, anaphylactoid reaction, bilirubinemia, bronchospasm, bullous eruption, fatty liver, granulocytopenia, hematuria, hemoptysis, hemorrhagic stroke (0.1%), hemothorax, hypochromic anemia, intracranial hemorrhage (0.4%), ischemic necrosis, leukopenia, maculopapular rash, menorrhagia, neutropenia (0.05%), ocular hemorrhage, paresthesia, pulmonary hemorrhage, purpura, retroperitoneal bleeding, thrombocytopenia, urticaria

Postmarketing and/or case reports: Acute liver failure, aplastic anemia, angioedema, confusion, erythema multiforme, hallucination, hepatitis, hypersensitivity, interstitial pneumonitis, lichen planus, pancreatitis, pancytopenia, serum sickness, Stevens-Johnson syndrome, stomatitis, taste disorder, thrombotic thrombocytic purpura (TTP), toxic epidermal necrolysis, vasculitis

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 3A4; **Inhibits** CYP2C9 (weak)

Drug Interactions

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Atorvastatin: May diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Calcium Channel Blockers: May diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Macrolide Antibiotics: May diminish the therapeutic effect of Clopidogrel. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Proton Pump Inhibitors: May diminish the therapeutic effect of Clopidogrel. This appears to be due to reduced formation of the active clopidogrel metabolite. *Risk C: Monitor therapy*

Rifamycin Derivatives: May enhance the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Warfarin: Clopidogrel may enhance the anticoagulant effect of Warfarin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, chamomile, coleus, cordyceps, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American), ginseng (Panax), ginseng (Siberian), grape seed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersSigns of bleeding; hemoglobin and hematocrit periodically

Nursing: Physical Assessment/MonitoringAssess effectiveness or interactions of other medications patient may be taking. Clopidogrel is a P450 enzyme inhibitor. Monitor for unusual bleeding. Monitor therapeutic effectiveness and teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsHemoglobin and hematocrit periodically

Patient EducationTake as directed. May cause headache or dizziness; use caution when driving or engaging in tasks that require alertness until response to drug is known. It may take longer than usual to stop bleeding. Small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may reduce nausea or vomiting. Mild analgesics may reduce arthralgia or back pain. Inform prescribers and dentists that you are taking this medication prior to scheduling any surgery or dental procedure. Report immediately unusual or acute chest pain or respiratory difficulties; skin rash; unresolved bleeding, diarrhea, or GI distress; nosebleed; or acute headache. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Plavix®: 75 mg, 300 mg

Generic AvailableNo

ManufacturerSanofi-Aventis

Pricing: U.S. (www.drugstore.com)

Tablets (Plavix)

75 mg (30): $135.99

Mechanism of ActionClopidogrel requires *in vivo* biotransformation to an unidentified active metabolite. This active metabolite irreversibly blocks the $P2Y_{12}$ component of ADP receptors on the platelet surface, which prevents activation of the GPIIb/IIIa receptor complex, thereby reducing platelet aggregation. Platelets blocked by clopidogrel are affected for the remainder of their lifespan.

Pharmacodynamics/Kinetics

Onset of action: Inhibition of platelet aggregation detected: 2 hours after 300 mg administered; after second day of treatment with 50-100 mg/day. At steady-state with 75 mg/day, the average inhibition level observed was 40% to 60%.

Peak effect: 50-100 mg/day: Bleeding time: 5-6 days; Platelet function: 3-7 days

Absorption: Well absorbed

Protein binding: Parent drug: 98%; metabolite: 94%

Metabolism: Extensively hepatic via hydrolysis; biotransformation primarily to carboxyl acid derivative (inactive). The active metabolite that inhibits platelet aggregation has not been isolated.

Half-life elimination: ~8 hours

Time to peak, serum: ~1 hour

Excretion: Urine (50%); feces (46%)

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant the discontinuance of clopidogrel prior to dental surgery. Patients taking one clopidogrel tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with physician.

Dental Health: Effects on Dental TreatmentAspirin and clopidogrel (Plavix®) in combination is the primary prevention strategy against stent thrombosis after placement of drug-eluting metal stents in coronary patients. Premature discontinuation of this combination antiplatelet therapy strongly increases the risk of a catastrophic event of stent thrombosis leading to myocardial infarction and/or death, so says a science advisory issued in January 2007 from the American Heart Association in collaboration with the American Dental Association and other professional healthcare organizations. The advisory stresses a 12-month therapy of aspirin and Plavix® combination after placement of a drug-eluting stent in order to prevent thrombosis at the stent site. Any elective surgery should be postponed for 1 year after stent implantation, and if surgery must be performed, consideration should be given to continuing the antiplatelet therapy during the perioperative period in high-risk patients with drug-eluting stents.

This advisory was issued from a science panel made up of representatives from the American Heart Association (AHA), the American College of Cardiology, the Society for Cardiovascular Angiography and Interventions, the American College of Surgeons, the American Dental Association (ADA), and the American College of Physicians (Grines, 2007).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, dizziness, confusion, hallucinations, insomnia, or anxiety

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concurrent use with SSRIs and/or valproic acid may produce additive effects. Flu-like syndrome may occur and present like SSRI-discontinuation symptoms. Hematologic side effects have rarely been reported; monitor with clozapine, carbamazepine, and valproate.

Cardiovascular Considerations

Acute Coronary Syndrome (ACS): The 2007 ACC/AHA guidelines for unstable angina/non-ST-segment elevation myocardial infarction (UA/NSTEMI) recommend administration of clopidogrel to hospitalized patients who are unable to take aspirin because of hypersensitivity or major gastrointestinal intolerance (Class I; level of evidence: A). In certain situations, patients may even be desensitized to aspirin so that they may receive aspirin and clopidogrel concurrently. The CURE trial demonstrated that clopidogrel reduced major cardiovascular events in patients with ACS without ST-segment elevation (Yusuf S, 2001). In this trial, the risk of major bleeding was significantly increased in the clopidogrel group although life-threatening bleeding and hemorrhagic strokes were similar in both groups. In hospitalized UA/NSTEMI patients in whom an early noninvasive strategy is planned, clopidogrel should be added to aspirin and anticoagulant therapy as soon as possible (Class I, Level of evidence A).

In UA/NSTEMI patients in whom an invasive strategy will be employed, antiplatelet therapy should be initiated prior to diagnostic angiography. This can be done with either clopidogrel or a glycoprotein IIb/IIIa inhibitor (eg, eptifibatide) (Class I, Level of evidence A). The PCI-CURE trial, a substudy of the CURE trial, suggested that in patients with ACS undergoing PCI receiving aspirin, a strategy of clopidogrel pretreatment followed by long-term therapy (9 months) is beneficial in reducing major cardiovascular events, compared with placebo (Mehta SR, 2001). In the CREDO trial, long-term (1 year) clopidogrel treatment (75 mg daily) following PCI, significantly reduced the risk of adverse ischemic events (Steinhubl SR, 2002). In CREDO, the issue of timing was evaluated and a 300 mg loading dose of clopidogrel must be given at least 6 hours before PCI. More recently, however, a 600 mg loading dose of clopidogrel was shown to result in maximal platelet inhibition at 2 hours (Hochholzer W, 2005).

In patients taking clopidogrel in whom elective CABG is planned, clopidogrel should be withheld for 5-7 days before elective CABG. If urgent CABG is required, the benefits of surgery should outweigh the risks of incremental bleeding.

ST-Segment Elevation Myocardial Infarction (STEMI): The COMMIT trial (Chen ZM, 2005), randomized 45,852 patients with an acute MI (supporting ECG abnormalities), presenting within 24 hours of onset of symptoms, to clopidogrel 75 mg daily or placebo. All patients received aspirin and standard medical care (eg, thrombolytics if appropriate, ACEI). Clopidogrel was continued for 28 days or until hospital discharge whichever came first. The primary outcome measure was a composite of death, MI, or stroke. Patients in the clopidogrel arm had a significantly lower death rate (7.5% clopidogrel, 8.1% placebo; p=0.002).The CLARITY trial (Scirica BM, 2006) evaluated clopidogrel in the setting of thrombolysis and its relationship to ST-segment resolution. The randomized, double blind, placebo controlled trial included 3491 patients within 12 hours of the onset of STEMI who were candidates for thrombolytic therapy. Patients were randomized to receive clopidogrel (300 mg loading dose, then 75 mg daily) or placebo until angioplasty, discharge, or Day 8. Patients also received aspirin (loading dose followed by 75-162 mg/day). The ECG was monitored at baseline, and 90- and 180 minutes after thrombolysis. There was no difference in ECG resolution (none, partial, complete) between the groups at 90 minutes. Patients with partial (30% to 70%) and complete (>70%) ST-segment resolution on clopidogrel had significantly improved patency on discharge angiogram over placebo patients with similar ST-segment resolution. The clopidogrel group with partial ST segment resolution had a significantly lower rate of in-hospital death and MI than their placebo counterparts. The clopidogrel group with complete resolution of ST-segments showed a trend toward a reduction of in-hospital death and MI but it was not statistically significant (p=0.056). Mortality was followed for 30 days; the clopidogrel group with complete resolution of ST-segment abnormalities had a significant reduction in the rate of death compared to its placebo counterpart.

Percutaneous Coronary Intervention (PCI): The 2004 ACC/AHA guidelines for ST-elevation myocardial infarction (STEMI) suggests that clopidogrel be continued for at least 1 month after bare-metal stent implantation, for several months after drug-eluting stent implantation (3 months for sirolimus, 6 months for paclitaxel), and ideally for up to 12 months in patients who are not at high risk for bleeding.

Coronary Artery Stents: The 2005 ACC/AHA/SCAI guidelines for PCI recommends that along with aspirin, clopidogrel be continued for at least 1 month after bare-metal stent implantation, for several months after drug-eluting stent implantation (3 months for sirolimus, 6 months for paclitaxel), and ideally for up to 12 months in patients who are not at high risk for bleeding. Clopidogrel is the preferred thienopyridine due to its lower incidence of serious side effects (eg, neutropenia) as compared to ticlopidine.

The 2008 *Chest* guidelines recommend for patients who undergo PCI and receive a BMS (with ongoing ACS) or a DES (with or without ongoing ACS) that clopidogrel be continued for at least 12 months. In patients receiving a BMS without ongoing ACS, clopidogrel may be continued for at least 1 month. In patients receiving a DES, therapy with clopidogrel beyond 12 months may be considered in patients without bleeding or tolerability issues (Becker, 2008).

The AHA/ACC/SCAI/ACS/ADA Science Advisory (2007) published recommendations (*Circulation*, February 13, 2007) to prevent premature discontinuation of dual antiplatelet therapy (clopidogrel, aspirin) in patients with coronary artery stents. This advisory panel agreed with the 2004 ACC/AHA guidelines stressing the importance of 12 months of dual antiplatelet therapy after placement of a drug-eluting stent (DES) in patients who are not at high risk of bleeding. The advisory panel included these recommendations. Minor surgery, teeth cleaning, and tooth extraction can usually be performed without increased bleeding on the dual antiplatelet regimen. If increased bleeding is anticipated, then the procedure should be delayed until the antiplatelet regimen is completed. Elective procedures with a significant risk of bleeding should be postponed until the antiplatelet regimen is completed. The Advisory panel recommends healthcare providers who perform invasive or surgical procedures contact the patient's cardiologist before discontinuing antiplatelet therapy. For patients with drug-eluting stents who must undergo a procedure that requires discontinuation of thienopyridine therapy, aspirin should be continued if possible and the thienopyridine restarted as soon as possible after the procedure. "Bridging" stent patients with warfarin, other antithrombins, or glycoprotein IIb/IIIa agents is not supported by the Advisory Committee.

For the complete review and additional recommendations available at
http://www.acc.org/qualityandscience/clinical/pdfs/Final_Dual_Antiplatelet_Statement_010507.pdf.

High Cardiovascular-Event Risk Patients: The CHARISMA trial (Bhatt DL, 2006) evaluated the use of clopidogrel compared to placebo in 15,603 patients receiving low-dose aspirin (75-162 mg/day) who were at high risk of future cardiovascular events. This patient group included those with multiple atherothrombotic risk factors, documented coronary, cerebrovascular, or peripheral vascular disease. The primary outcome measure was a composite of myocardial infarction, stroke, or death from cardiovascular causes. The primary outcome measure occurred in 6.8% of patients receiving clopidogrel and aspirin vs. 7.3% with placebo and aspirin (p=0.22). The rates of the secondary endpoints which included hospitalizations for ischemic events, was 16.7% and 17.9% (p=0.04). The rate of GUSTO-defined severe bleeding was 1.7% and 1.3% (p=0.09). A prespecified subgroup analysis divided patients into a "symptomatic" group (with documented cardiovascular disease) and an "asymptomatic" group (without documented cardiovascular disease). In the patients considered symptomatic, the primary event rate was lower in the clopidogrel group compared to placebo (6.9% vs 7.9%, p=0.046). In patients considered asymptomatic, there was a 20% relative increase in the primary event rate (6.6% vs 5.5%; p=0.20) if receiving clopidogrel. The rate of death from cardiovascular causes was also higher in this group (3.9% vs 2.2%, p=0.01). In summary, clopidogrel in addition to low-dose aspirin is not significantly more effective than low-dose aspirin alone in reducing the rate of MI, stroke, or death from cardiovascular causes. Use of clopidogrel in addition to low-dose aspirin may be harmful in patients with multiple atherothrombotic risk factors without cardiovascular disease. The American College of Chest Physicians recommends against the routine use of clopidogrel (in addition to aspirin) for primary prevention unless the patient has an aspirin allergy and is at moderate-to-high risk for a cardiovascular event (Becker, 2008).

Anesthesia and Critical Care Concerns/Other Considerations **Perioperative Management of Clopidogrel:**

In patients with coronary stents, the risk of stent thrombosis becomes elevated depending on the type of stent deployed (bare metal vs drug-eluting stent) and the time from implantation. According to the American College of Chest Physicians (Becker, 2008), the recommended length of therapy for clopidogrel is at least 12 months in patients with ACS who undergo PCI with a bare metal stent (BMS) or drug-eluting stent (DES). In patients receiving a BMS without ongoing ACS, clopidogrel may be continued for at least 1 month. Early discontinuation of clopidogrel may result in stent thrombosis leading to nonfatal and fatal myocardial infarction. The perioperative recommendations for clopidogrel are below (Douketis, 2008):

Patients undergoing noncardiac surgery (low risk of cardiac event without coronary stent): Clopidogrel and other antiplatelet agents should be temporarily discontinued 5-10 days prior to surgery and resumed ~24 hours (or the next morning) after the procedure when adequate hemostasis is achieved.

Patients without coronary stent undergoing cardiac surgery (eg, CABG) or noncardiac surgery (high risk of cardiac event): Discontinue clopidogrel at least 5 days and, preferably, 10 days prior to surgery while continuing aspirin up to and beyond the time of surgery. If aspirin is interrupted, it should be reinitiated 6-48 hours after surgery; may resume clopidogrel ~24 hours (or the next morning) after the procedure when adequate hemostasis is achieved.

Patients undergoing cardiac surgery (eg, CABG) or noncardiac surgery (with coronary stent): Based on the risk of stent thrombosis, patients with a BMS who require surgery within 6 weeks of implantation or with a DES who require surgery within 12 months of implantation should continue on both aspirin and clopidogrel during the perioperative period.

The AHA/ACC/SCAI/ACS/ADA Science Advisory (2007) published recommendations (*Circulation*, February 13, 2007) to prevent premature discontinuation of dual antiplatelet therapy (clopidogrel and aspirin) in patients with coronary artery stents. The advisory panel agreed with the 2004 ACC/AHA guidelines stressing the importance of 12 months of dual antiplatelet therapy after placement of a drug-eluting stent (DES) in patients who are not at high risk of bleeding. The advisory panel included these recommendations. Minor surgery, teeth cleaning, and tooth extraction can usually be performed without increased bleeding on the dual antiplatelet regimen. If increased bleeding is anticipated, then the procedure should be delayed until the antiplatelet regimen is completed. Elective procedures with a significant risk of bleeding should be postponed until the antiplatelet regimen is completed. The advisory panel recommends healthcare providers who perform invasive or surgical procedures contact the patient's cardiologist before discontinuing antiplatelet therapy. For patients with drug-eluting stents who must undergo a procedure that requires discontinuation of thienopyridine therapy, aspirin should be continued if possible and the thienopyridine restarted as soon as possible after the procedure. "Bridging" stent patients with warfarin, other antithrombins, or glycoprotein IIb/IIIa agents is not supported by the Advisory Committee.

Clorazepate

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Clorazepate may be confused with clofibrate, clonazepam

Pronunciation(klor AZ e pate)

U.S. Brand NamesTranxene® SD™; Tranxene® SD™-Half Strength; Tranxene® T-Tab®

Canadian Brand NamesApo-Clorazepate®; Novo-Clopate

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsTreatment of generalized anxiety disorder; management of ethanol withdrawal; adjunct anticonvulsant in management of partial seizures

Dosing: Adults

Anxiety:

Regular release tablets (Tranxene® T-Tab®): 7.5-15 mg 2-4 times/day

Sustained release (Tranxene® SD™): 11.25 or 22.5 mg once daily at bedtime

Ethanol withdrawal: Oral: Initial: 30 mg, then 15 mg 2-4 times/day on first day; maximum daily dose: 90 mg; gradually decrease dose over subsequent days.

Seizures (anticonvulsant): Oral: Initial: Up to 7.5 mg/dose 2-3 times/day; increase dose by 7.5 mg at weekly intervals; not to exceed 90 mg/day

Dosing: ElderlyOral: Anxiety: 7.5 mg 1-2 times/day; use is not recommended in the elderly.

Dosing: Pediatric

Seizures (anticonvulsant): Oral:

Children 9-12 years: Initial: 3.75-7.5 mg/dose twice daily; increase dose by 3.75 mg at weekly intervals, not to exceed 60 mg/day in 2-3 divided doses.

Children >12 years: Refer to adult dosing.

RestrictionsC-IV

ContraindicationsHypersensitivity to clorazepate or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); narrow-angle glaucoma; pregnancy

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.

• CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

• Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

• Depression: Use caution in patients with depression, particularly if suicidal risk may be present.

• Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

• Hepatic impairment: Use with caution in patients with hepatic impairment.

• Impaired gag reflux: Use with caution in patients with an impaired gag reflux.

• Renal impairment: Use with caution in patients with renal impairment.

• Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.
- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury. Active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.
- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.
- Pediatrics: Safety and efficacy have not been established in children <9 years of age.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.
- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsDue to its long-acting metabolite, clorazepate is not considered a drug of choice in the elderly. Long-acting benzodiazepines have been associated with falls in the elderly. Interpretive guidelines from the Centers for Medicare and Medicaid Services (CMS) discourage the use of this agent in residents of long-term care facilities.
Pregnancy Risk FactorD
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsNo specific data for clorazepate; however, other benzodiazepines have been shown to be excreted in breast milk. Therefore, it is recommended not to nurse while taking clorazepate.
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension

Central nervous system: Drowsiness, fatigue, ataxia, lightheadedness, memory impairment, insomnia, anxiety, headache, depression, slurred speech, confusion, nervousness, dizziness, irritability

Dermatologic: Rash

Endocrine & metabolic: Libido decreased

Gastrointestinal: Xerostomia, constipation, diarrhea, salivation decreased, nausea, vomiting, appetite increased or decreased

Neuromuscular & skeletal: Dysarthria, tremor

Ocular: Blurred vision, diplopia

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Serum concentrations/toxicity may be increased by grapefruit juice.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsDecreased hematocrit; abnormal liver and renal function tests

Monitoring ParametersRespiratory and cardiovascular status, excess CNS depression

Reference RangeTherapeutic: 0.12-1 mcg/mL (SI: 0.36-3.01 µmol/L)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess for CNS depression. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. Do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, confusion, depression, increased sedation, excitation, headache, agitation, insomnia or nightmares, dizziness, fatigue, impaired coordination, changes in personality, or changes in cognition); changes in urinary pattern; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances; chest pain, palpitations, or rapid heartbeat; excessive perspiration; excessive GI symptoms (cramping, constipation, vomiting, anorexia); or worsening of condition. **Pregnancy/breast-feeding precautions**: Do not get pregnant while using this medication; use appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as dipotassium: 3.75 mg, 7.5 mg, 15 mg

Tranxene® SD™: 22.5 mg [once daily]

Tranxene® SD™-Half Strength: 11.25 mg [once daily]

Tranxene® T-Tab®: 3.75 mg, 7.5 mg, 15 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Tranxene-SD)

11.25 mg (30): $211.03

22.5 mg (30): $268.78

Tablets (Clorazepate Dipotassium)

3.75 mg (90): $68.00

7.5 mg (90): $83.99

15 mg (90): $113.99

Tablets (Tranxene-T)

3.75 mg (90): $260.58

7.5 mg (90): $308.99

15 mg (90): $435.68

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Duration: Variable, 8-24 hours

Distribution: Crosses placenta; appears in urine

Metabolism: Rapidly decarboxylated to desmethyldiazepam (active) in acidic stomach prior to absorption; hepatically to oxazepam (active)

Half-life elimination: Adults: Desmethyldiazepam: 48-96 hours; Oxazepam: 6-8 hours

Time to peak, serum: ~1 hour

Excretion: Primarily urine

- CMS: Long-Term Care Facility Thresholds
- Discontinuation of Psychotropic Drugs
- Status Epilepticus
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsAbrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Many patients will experience drowsiness; orthostatic hypotension is possible. It is suggested that narcotic analgesics not be given for pain control to patients taking clorazepate due to enhanced sedation.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Clorazepate is a long half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Anesthesia and Critical Care Concerns/Other ConsiderationsAbrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Clotrimazole may be confused with co-trimoxazole

Lotrimin® may be confused with Lotrisone®, Otrivin®

Mycelex® may be confused with Myoflex®

International issues:

Cloderm®: Brand name for clocortolone in the United States

Canesten® [multiple international markets] may be confused with Cenestin® which is a brand name for estrogens (conjugated a/synthetic) in the U.S.

Canesten® [multiple international markets]: Brand name for fluconazole in Great Britain

Mycelex® may be confused with Mucolex® which is a brand name for carbocysteine in Ireland, Portugal, and Thailand; a brand name for guaifenesin in Hong Kong

Pronunciation(kloe TRIM a zole)

U.S. Brand NamesCruex® Cream [OTC]; Gyne-Lotrimin® 3 [OTC]; Gyne-Lotrimin® 7 [OTC]; Lotrimin® AF Athlete's Foot Cream [OTC]; Lotrimin® AF for Her [OTC]; Lotrimin® AF Jock Itch Cream [OTC]; Mycelex®

Canadian Brand NamesCanesten® Topical; Canesten® Vaginal; Clotrimaderm; Trivagizole-3®

Pharmacologic CategoryAntifungal Agent, Oral Nonabsorbed; Antifungal Agent, Topical; Antifungal Agent, Vaginal

Use: Labeled IndicationsTreatment of susceptible fungal infections, including oropharyngeal candidiasis, dermatophytoses, superficial mycoses, and cutaneous candidiasis, as well as vulvovaginal candidiasis; limited data suggest that clotrimazole troches may be effective for prophylaxis against oropharyngeal candidiasis in neutropenic patients

Use: DentalTreatment of susceptible fungal infections, including oropharyngeal candidiasis; limited data suggests that the use of clotrimazole troches may be effective for prophylaxis against oropharyngeal candidiasis in neutropenic patients

Dosing: Adults

Oropharyngeal candidiasis: Oral:

Prophylaxis: 10 mg troche dissolved 3 times/day for the duration of chemotherapy or until steroids are reduced to maintenance levels

Treatment: 10 mg troche dissolved slowly 5 times/day for 14 consecutive days

Dermatophytosis, cutaneous candidiasis: Topical (cream, solution): Apply twice daily; if no improvement occurs after 4 weeks of therapy, re-evaluate diagnosis.

Vulvovaginal candidiasis: Intravaginal:

Cream (1%): Insert 1 applicatorful of 1% vaginal cream daily (preferably at bedtime) for 7 consecutive days.

Cream (2%): Insert 1 applicatorful of 2% vaginal cream daily (preferably at bedtime) for 3 consecutive days.

Tablet: Insert 100 mg/day for 7 days or 500 mg single dose.

Dermatologic infection (superficial): Topical (cream, solution): Apply to affected area twice daily (morning and evening) for 7 consecutive days.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Oropharyngeal candidiasis: Children >3 years: Refer to adult dosing.

Vaginal, Topical infections: Children >12 years: Refer to adult dosing.

Administration: OralTroche: Allow to dissolve slowly over 15-30 minutes.

Administration: TopicalFor external use only. Apply sparingly. Protect hands with latex gloves. Do not use occlusive dressings.

Administration: OtherAvoid contact with eyes.

ContraindicationsHypersensitivity to clotrimazole or any component of the formulation

Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Disease-related concerns:

- Systemic fungal infection: Clotrimazole should not be used for treatment of systemic fungal infection.

Special populations:

- Pediatrics: Safety and efficacy of clotrimazole lozenges (troches) have not been established in children <3 years of age.

Dosage form specific issues:

- Topical: When using topical formulation, avoid contact with eyes.

Geriatric ConsiderationsLocalized fungal infections frequently follow broad-spectrum antimicrobial therapy. Specifically, oral and vaginal infections due to *Candida*.

Pregnancy Risk FactorB (topical); C (troches)

LactationExcretion in breast milk unknown

Adverse Reactions

Oral:

>10%: Hepatic: Abnormal liver function tests

1% to 10%:

Gastrointestinal: Nausea and vomiting may occur in patients on clotrimazole troches

Local: Mild burning, irritation, stinging to skin or vaginal area

Vaginal:

1% to 10%: Genitourinary: Vulvar/vaginal burning

<1% (Limited to important or life-threatening): Vulvar itching, soreness, edema, or discharge; polyuria; burning or itching of penis of sexual partner

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak), 2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (moderate)

Drug Interactions

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Monitoring ParametersPeriodic liver function tests during oral therapy with clotrimazole troche

Nursing: Physical Assessment/MonitoringMonitor laboratory values, effectiveness of treatment, and adverse reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. Assess for opportunistic infection.

Monitoring: Lab TestsPeriodic liver function during oral therapy with clotrimazole troche

Patient Education

Oral (troche): Do not swallow oral medication whole; allow to dissolve slowly in mouth. You may experience nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report signs of opportunistic infection (eg, white plaques in mouth, fever, chills, perianal itching, vaginal itching or discharge, fatigue, unhealed wounds or sores).

Topical: Avoid contact with eyes. Wash hands before applying or wear gloves. Apply thin film to affected area. May apply porous dressing. Report persistent burning, swelling, itching, worsening of condition, or lack of response to therapy.

Vaginal: Wash hands before using. Insert full applicator into vagina gently and expel cream, or insert tablet into vagina, at bedtime. Wash applicator with soap and water following use. Remain lying down for 30 minutes following administration. Avoid intercourse during therapy (sexual partner may experience penile burning or itching). Report adverse reactions (eg, vulvar itching, frequent urination), worsening of condition, or lack of response to therapy. Contact prescriber if symptoms do not improve within 3 days or you do not feel well within 7 days. Do not use tampons until therapy is complete. Contact prescriber immediately if you experience abdominal pain, fever, or foul-smelling discharge.

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, topical: 1% (15 g, 30 g, 45 g)

Cruex®: 1% (15 g) [contains benzyl alcohol]

Lotrimin® AF Athlete's Foot: 1% (12 g) [contains benzyl alcohol]

Lotrimin® AF Jock Itch: 1% (12 g) [contains benzyl alcohol]

Lotrimin® AF for Her: 1% (24 g) [contains benzyl alcohol]

Cream, topical/vaginal: 1% (45 g)

Gyne-Lotrimin® 7: 1% (45 g) [contains benzyl alcohol; packaged with refillable applicator]

Cream, vaginal: 2% (21 g)

Gyne-Lotrimin® 3: 2% (21 g) [contains benzyl alcohol; packaged with 3 disposable applicators]

Solution, topical: 1% (10 mL, 30 mL)

Tablet, vaginal:

Gyne-Lotrimin® 3: 200 mg (3s) [DSC]

Troche, oral: 10 mg

Mycelex®: 10 mg

Generic AvailableYes: Cream, solution, troche

Pricing: U.S. (www.drugstore.com)

Cream (Clotrimazole)

1% (15): $17.99

1% (30): $42.62

1% (45): $55.75

Solution (Clotrimazole)

1% (10): $17.99

1% (30): $24.99

Troche (Clotrimazole)

10 mg (70): $89.99

Troche (Mycelex)

10 mg (70): $122.98

Mechanism of ActionBinds to phospholipids in the fungal cell membrane altering cell wall permeability resulting in loss of essential intracellular elements

Pharmacodynamics/Kinetics

Absorption: Topical: Negligible through intact skin

Time to peak, serum:

Oral topical (troche): Salivary levels occur within 3 hours following 30 minutes of dissolution time

Vaginal cream: High vaginal levels: 8-24 hours

Vaginal tablet: High vaginal levels: 1-2 days

Excretion: Feces (as metabolites)

Related Information

- Treatment of Sexually-Transmitted Infections

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cloxacillin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(kloks a SIL in)

Canadian Brand NamesApo-Cloxi®; Cloxacillin; Novo-Cloxin; Nu-Cloxi

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of susceptible bacterial infections, including beta-hemolytic streptococci, pneumococci, and penicillinase-producing staphylococci causing respiratory tract, skin and skin structure, bone and joint, urinary tract infections

Use: DentalTreatment of susceptible orofacial infections (notably penicillinase-producing staphylococci)

Dosing: Adults**Note:** Dose and duration of therapy can vary depending on infecting organism, severity of infection, and clinical response of patient. Treat beta-hemolytic streptococcal infections at least 10 days to prevent the occurrence of rheumatic fever or acute glomerulonephritis. Treat severe staphylococcal infections for at least 14 days; endocarditis and osteomyelitis require an extended duration of therapy

Susceptible infections:

Oral: 250-500 mg every 6 hours (manufacturer recommended maximum adult dose: 6 g/day)

I.M., I.V.: 250-500 mg every 6 hours (manufacturer recommended maximum adult dose: 6 g/day)

Dosing recommendations of World Health Organization unless otherwise noted:

Arthritis (septic), methicillin-sensitive *Staphylococcus aureus* (MSSA) (unlabeled dosing): I.M., I.V.: 2 g every 6 hours for 2-3 weeks; **Note:** Oral therapy of 1 g every 6 hours may be used to complete therapy if parenteral therapy is discontinued prior to 2-3 week duration

Endocarditis (MSSA) (unlabeled dosing): I.V.:

Native valve: 2 g every 4 hours for 6 weeks; give with gentamicin for initial 5 days (Choudri, 2000)

Prosthetic valve: 2 g every 4 hours for 6 weeks; give with gentamicin for 2 weeks and rifampin for 6 weeks (Choudri, 2000)

Osteomyelitis (MSSA) (unlabeled dosing): I.M., I.V.: 2 g every 6 hours for 4-6 weeks (preferred) **or** for a minimum of 14 days, **followed by** 1 g every 6 hours orally to complete 4-6 weeks of therapy

Pneumonia (MSSA) (unlabeled dosing): I.M., I.V.: 1-2 g every 6 hours for 10-14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Dose and duration of therapy can vary depending on infecting organism, severity of infection, and clinical response of patient. Treat beta-hemolytic streptococcal infections at least 10 days to prevent the occurrence of rheumatic fever or acute glomerulonephritis. Treat severe staphylococcal infections for at least 14 days; endocarditis and osteomyelitis require an extended duration of therapy.

Susceptible infections:

Oral:

Children ≤20 kg: 25-50 mg/kg/day in divided doses every 6 hours

Children >20 kg: Refer to adult dosing.

I.M., I.V.:

Children ≤20 kg: 25-50 mg/kg/day in divided doses every 6 hours; up to 200 mg/kg/day has been used in some studies for severe infections

Children >20 kg: Refer to adult dosing.

Dosing recommendations of World Health Organization unless otherwise noted:

Arthritis (septic), methicillin-sensitive *Staphylococcus aureus* (MSSA) (unlabeled dosing):

Children 2 months to 5 years: I.M., I.V.: 25-50 mg/kg every 4-6 hours given with ceftriaxone until clinical improvement, **followed by** oral therapy: 12.5 mg/kg (maximum: 500 mg) every 6 hours; total duration of therapy 2-3 weeks

Children >5 years: I.M., I.V.: 25-50 mg/kg (maximum: 2 g) every 4-6 hours (maximum daily dose: 12 g/day) until clinical improvement, **followed by** oral therapy: 25 mg/kg (maximum: 500 mg) every 6 hours; total duration of therapy 2-3 weeks

Endocarditis (MSSA) (unlabeled dosing): I.V.: 50 mg/kg (maximum: 2 g) every 4 hours for 6 weeks; give with gentamicin for initial 7 days

Osteomyelitis (MSSA) (unlabeled dosing):

Children 2 months to 5 years: I.M., I.V.: 25-50 mg/kg every 4-6 hours given with ceftriaxone until clinical improvement, **followed by** oral therapy: 12.5 mg/kg (maximum: 500 mg) every 6 hours; total duration of therapy 3-4 weeks

Children >5 years: I.M., I.V.: 25-50 mg/kg (maximum: 2 g) every 4-6 hours (maximum daily dose: 12 g/day) until clinical improvement, **followed by** oral therapy: 25 mg/kg (maximum: 500 mg) every 6 hours; total duration of therapy 3-4 weeks

Pneumonia (MSSA) (unlabeled dosing):

Children 2 months to 5 years: Oral: 25-50 mg/kg (maximum: 2 g) every 6 hours for at least 3 weeks with gentamicin

Children >5 years: I.M., I.V.: 50 mg/kg (maximum: 2 g) every 6 hours for 10-14 days

Dosing: Renal ImpairmentNo dosage adjustment necessary.
Administration: I.M. Administer slowly over 2-4 minutes,
Administration: I.V.

I.V. push: Administer slowly over 2-4 minutes.

I.V. infusion: Administer over 30-40 minutes.

Administration: OralAdminister with water 1 hour before or 2 hours after meals.
Dietary ConsiderationsShould be taken 1 hour before or 2 hours after meals with water.
Storage

Capsule: Store at room temperature not exceeding 25˚C (77˚F).

Powder for injection: Store at controlled room temperature not exceeding 25˚C (77˚F). Upon reconstitution the resulting solution is stable for up to 24 hours at controlled room temperature and 48 hours under refrigeration.

I.V. infusion: **Note:** After reconstitution of powder with appropriate volume of sterile water for injection, the manufacturer suggests further dilution to concentrations of 1-2 mg/ml in a compatible solution (eg, D_5W, NS); solutions are stable for up to 12 hours at controlled room temperature.

Powder for oral solution: Prior to mixing, store powder at room temperature not exceeding 25˚C (77˚F). Refrigerate oral solution after reconstitution; discard after 14 days.

Reconstitution

I.M. injection: Vials should be reconstituted with appropriate volume of SWFI to make a final concentration of 125 mg/mL or 250 mg/mL

I.V. injection: Vials should be reconstituted with appropriate volume of SWFI to make a final concentration of 50 mg/mL or 100 mg/mL

I.V. infusion: Infusion is prepared in 2 stages: Initial reconstitution of powder with appropriate volume of SWFI, followed by dilution to final infusion solution.

Compatibility

Solutions: Stable in NS, LR; **variable stability (consult detailed reference):** D_5W.

Compatibility in syringe: Compatible: chloramphenicol, colistimethate, dimenhydrinate, lidocaine, procaine; **incompatible** with erythromycin, gentamicin, pantoprazole, polymyxin B; **variable (consult detailed reference):** Hydromorphone, kanamycin, lincomycin, streptomycin.

Compatibility when admixed: Compatible: Amikacin, floxacillin, furosemide, heparin, hydrocortisone sodium succinate, potassium chloride; **incompatible** with chlorpromazine, gentamicin.

RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to cloxacillin, other penicillins, cephalosporins, or any component of the formulation
Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- CNS effects: Although not reported with cloxacillin, the transport of penicillins across the blood brain barrier may be enhanced by inflamed meninges or during cardiopulmonary bypass. An increased risk of myoclonia, seizures, or reduced consciousness may be observed in these patients (particularly those with renal failure).

- Hematologic effects: Penicillin use has been associated with hematologic disorders (eg, agranulocytosis, neutropenia, thrombocytopenia) believed to be a hypersensitivity phenomena. Reactions are most often reversible upon discontinuing therapy.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; rate of elimination is reduced.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; high serum levels, particularly in the presence of renal impairment, may increase risk for seizures

Special populations:

- Neonates: May have decreased renal clearance of cloxacillin; frequent evaluation of serum levels and of clinical status for adverse effects as well as frequent dosage adjustments may be necessary in this patient population;

Geriatric ConsiderationsDosage change for renal function is not necessary.
Pregnancy ConsiderationsCloxacillin crosses the placenta and distributes into fetal tissue. In general, penicillins as a class are considered safe for use during pregnancy.
LactationEnters breast milk/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension

Central nervous system: Confusion, fever, lethargy, seizure (high doses and/or renal failure)

Dermatologic: Pruritus, rash, urticaria

Gastrointestinal: Abdominal pain, black or hairy tongue, diarrhea, flatulence, nausea, oral candidiasis, pseudomembranous colitis, stomatitis, vomiting

Hematologic: Agranulocytosis, bone marrow depression, eosinophilia, granulocytopenia, hemolytic anemia, leukopenia, neutropenia, thrombocytopenia

Hepatic: Alkaline phosphatase increased, ALT increased, AST increased, hepatotoxicity

Local: Thrombophlebitis

Neuromuscular & skeletal: Arthralgia, myalgia, myoclonus

Renal: Hematuria, interstitial nephritis, proteinuria, renal insufficiency, renal tubular damage

Respiratory: Bronchospasm, laryngeal edema, laryngospasm, sneezing, wheezing

Miscellaneous: Anaphylaxis, angioedema, allergic reaction, serum sickness-like reaction

Drug Interactions

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Decreases cloxacillin absorption; serum levels are reduced by ~50%.
Test InteractionsMay interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®); may inactivate aminoglycosides *in vitro*; false-positive urine and serum proteins; false-positive in uric acid, urinary steroids
Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose; CBC with differential (prior to initiating therapy and weekly thereafter), periodic BUN, creatinine, hepatic function
Monitoring: Lab TestsCBC with differential (prior to initiating therapy and weekly thereafter), periodic BUN, creatinine, hepatic function
Patient EducationReport persistent diarrhea.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as sodium: 250 mg, 500 mg [not available in the U.S.]

Injection, powder for reconstitution: 250 mg, 500 mg, 1000 mg, 2000 mg [not available in the U.S.]

Powder for suspension, oral, as sodium: 125 mg/5 mL (60 mL, 100 mL, 200 mL) [not available in the U.S.]

Generic AvailableYes
Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibit the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.
Pharmacodynamics/Kinetics

Absorption: Oral: ~50%; reduced by food

Distribution: Widely to most body fluids and bone; penetration into cells, into eye, and across normal meninges is poor; crosses placenta; enters breast milk; inflammation increases amount that crosses blood-brain barrier

Protein binding: ~94% (primarily albumin)

Metabolism: Extensively hepatic to active and inactive metabolites

Half-life elimination: 0.5-1.5 hours; prolonged with renal impairment and in neonates

Time to peak, serum: ~1 hour

Excretion: Urine and feces

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Prolonged use of penicillins may lead to development of oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusPenicillins have been reported to cause apprehension, illusions, agitation, insomnia, depersonalization, and encephalopathy

Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis; use caution with clozapine and carbamazepine

Index TermsCloxacillin Sodium

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Clozapine may be confused with clofazimine, clonidine, Klonopin®

Clozaril® may be confused with Clinoril®, Colazal®

Pronunciation(KLOE za peen)

U.S. Brand NamesClozaril®; FazaClo®

Canadian Brand NamesApo-Clozapine®; Clozaril®; Gen-Clozapine; PMS-Clozapine

Pharmacologic CategoryAntipsychotic Agent, Atypical

Use: Labeled IndicationsTreatment-refractory schizophrenia; to reduce risk of recurrent suicidal behavior in schizophrenia or schizoaffective disorder

Use: Unlabeled/InvestigationalSchizoaffective disorder, bipolar disorder, childhood psychosis, severe obsessive-compulsive disorder; psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Schizophrenia: Initial: 12.5 mg once or twice daily; increased, as tolerated, in increments of 25-50 mg/day to a target dose of 300-450 mg/day after 2-4 weeks; may require doses as high as 600-900 mg/day

Reduce risk of suicidal behavior: Initial: 12.5 mg once or twice daily; increased, as tolerated, in increments of 25-50 mg/day to a target dose of 300-450 mg/day after 2-4 weeks; median dose is ~300 mg/day (range: 12.5-900 mg)

Termination of therapy: If dosing is interrupted for ≥48 hours, therapy must be reinitiated at 12.5-25 mg/day; may be increased more rapidly than with initial titration, unless cardiopulmonary arrest occurred during initial titration.

In the event of planned termination of clozapine, gradual reduction in dose over a 1- to 2-week period is recommended. If conditions warrant abrupt discontinuation (leukopenia), monitor patient for psychosis and cholinergic rebound (headache, nausea, vomiting, diarrhea).

Patients discontinued on clozapine therapy due to WBC <2000/mm^3 or ANC <1000/mm^3 should not be restarted on clozapine.

Dosing: ElderlyOral: Experience in the elderly is limited; initial dose should be 25 mg/day; increase as tolerated by 25 mg/day to desired response. Maximum daily dose in the elderly should probably be 450 mg. Dose titration to 300-450 mg/day may be attained in 2 weeks if tolerated; however, elderly may require slower titration and daily increases may not be tolerated.

Psychosis/agitation related to Alzheimer’s dementia (unlabeled use): Initial: 12.5 mg/day; if necessary, gradually increase as tolerated not to exceed 75-100 mg/day

Dosing: PediatricChildren and Adolescents: Childhood psychosis (unlabeled use): Oral: Initial: 25 mg/day; increase to a target dose of 25-400 mg/day

Dosing: Adjustment for Toxicity

Moderate leukopenia or granulocytopenia (WBC <3000/mm^3 and/or ANC <1500/mm^3): Discontinue therapy; may rechallenge patient when WBC is >3500/mm^3 and ANC is >2000/mm^3. **Note:** Patient is at greater risk for developing agranulocytosis.

Severe leukopenia or granulocytopenia (WBC <2000/mm^3 and/or ANC <1000/mm^3): Discontinue therapy and do not rechallenge patient.

Calculations

- ANC: Absolute Neutrophil Count

Administration: OralOrally-disintegrating tablet: Should be removed from foil blister by peeling apart (do not push tablet through the foil). Remove immediately prior to use. Place tablet in mouth and allow to dissolve; swallow with saliva. If dosing requires splitting tablet, throw unused portion away.

Dietary ConsiderationsMay be taken without regard to food. Fazaclo™ contains phenylalanine 0.87 mg per 12.5 mg tablet, phenylalanine 1.74 mg per 25 mg tablet, and phenylalanine 6.96 mg per 100 mg tablet.

StorageDispensed in “clozapine patient system” packaging. Store at controlled room temperature. FazaClo™: Protect from moisture; do not remove from package until ready to use.

RestrictionsPatient-specific registration is required to dispense clozapine. Monitoring systems for individual clozapine manufacturers are independent. If a patient is switched from one brand/manufacturer of clozapine to another, the patient must be entered into a new registry (must be completed by the prescriber and delivered to the dispensing pharmacy). Healthcare providers, including pharmacists dispensing clozapine, should verify the patient's hematological status and qualification to receive clozapine with all existing registries. The manufacturer of Clozaril® requests that healthcare providers submit all WBC/ANC values following discontinuation of therapy to the Clozaril National Registry for all nonrechallengable patients until WBC is ≥3500/mm^3 and ANC is ≥2000/mm^3.

ContraindicationsHypersensitivity to clozapine or any component of the formulation; history of agranulocytosis or granulocytopenia with clozapine; uncontrolled epilepsy, severe central nervous system depression or comatose state; paralytic ileus; myeloproliferative disorders or use with other agents which have a well-known risk of agranulocytosis or bone marrow suppression

Warnings/Precautions

Boxed warnings:

- Agranulocytosis: See “Concerns related to adverse effects” below.
- Cardiovascular events: See “Concerns related to adverse effects” below.
- Dementia: See “Disease-related concerns” below.
- Orthostatic hypotension: See “Concerns related to adverse effects” below.
- Seizures: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Agranulocytosis: **[U.S. Boxed Warning]: Significant risk of agranulocytosis, potentially life-threatening.** Therapy should not be initiated in patients with WBC <3500 cells/mm^3 or ANC <2000 cells/mm^3 or history of myeloproliferative disorder. WBC testing should occur periodically on an on-going basis (see prescribing information for monitoring details) to ensure that acceptable WBC/ANC counts are maintained. Initial episodes of moderate leukopenia or granulopoietic suppression confer up to a 12-fold increased risk for subsequent episodes of agranulocytosis. WBCs must be monitored weekly for at least 4 weeks after therapy discontinuation or until WBC is ≥3500/mm^3 and ANC is ≥2000/mm^3. Use with caution in patients receiving other marrow suppressive agents. Eosinophilia has been reported to occur with clozapine and may require temporary or permanent interruption of therapy. Due to the significant risk of agranulocytosis, it is strongly recommended that a patient must fail at least two trials of other primary medications for the treatment of schizophrenia (of adequate dose and duration) before initiating therapy with clozapine.
- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems.
- Cardiovascular events: Myocarditis, pericarditis, pericardial effusion, cardiomyopathy, and HF have also been associated with clozapine. **[U.S. Boxed Warning]: Fatalities due to myocarditis have been reported; highest risk in the first month of therapy, however, later cases also**

reported. Myocarditis or cardiomyopathy should be considered in patients who present with signs/symptoms of heart failure (dyspnea, fatigue, orthopnea, paroxysmal nocturnal dyspnea, peripheral edema), chest pain, palpitations, new electrocardiographic abnormalities (arrhythmias, ST-T wave abnormalities), or unexplained fever. Patients with tachycardia during the first month of therapy should be closely monitored for other signs of myocarditis. Discontinue clozapine if myocarditis is suspected; do not rechallenge in patients with clozapine-related myocarditis. The reported rate of myocarditis in clozapine-treated patients appears to be 17-322 times greater than in the general population. Clozapine should be discontinued in patients with confirmed cardiomyopathy unless benefit clearly outweighs risk.

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is generally much lower relative to typical/conventional antipsychotics). Risk of dystonia (and probably other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Hyperglycemia: Atypical antipsychotics have been associated with development of hyperglycemia; in some cases, may be extreme and associated with ketoacidosis, hyperosmolar coma, or death. Use with caution in patients with diabetes or other disorders of glucose regulation; monitor for worsening of glucose control.

- Neuroleptic malignant syndrome (NMS): Use may be associated with neuroleptic malignant syndrome (NMS); monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.

- Orthostatic hypotension: **[U.S. Boxed Warning]: May cause orthostatic hypotension (with or without syncope) and tachycardia;** use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May be moderate to highly sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). Use with caution in patients receiving general anesthesia.

- Seizures: **[U.S. Boxed Warning]: Seizures have been associated with clozapine use in a dose-dependent manner;** use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold. Elderly patients may be at increased risk of seizures due to an increased prevalence of predisposing factors.

- Suicidal ideation: The possibility of a suicide attempt is inherent in psychotic illness or bipolar disorder; use with caution in high-risk patients during initiation of therapy. Prescriptions should be written for the smallest quantity consistent with good patient care.

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

- Thromboembolism: Rare cases of thromboembolism, including pulmonary embolism and stroke resulting in fatalities, have been associated with clozapine in patients with cardiovascular disease.

- Weight gain: Significant weight gain has been observed with antipsychotic therapy; incidence varies with product. Monitor waist circumference and BMI.

Disease-related concerns:

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related psychosis treated with atypical antipsychotics are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Clozapine is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic disease or impairment; hepatitis has been reported as a consequence of therapy.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Benzodiazepines: Concurrent use with benzodiazepines may increase the risk of severe cardiopulmonary reactions.

Special populations:

- Elderly: The elderly are more susceptible to adverse effects (including agranulocytosis, cardiovascular, anticholinergic, and tardive dyskinesia).

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt discontinuation: Medication should not be stopped abruptly; taper off over 1-2 weeks. If conditions warrant abrupt discontinuation (leukopenia, myocarditis, cardiomyopathy), monitor patient for psychosis and cholinergic rebound (headache, nausea, vomiting, diarrhea).

Cigarette smoking may enhance the metabolism of clozapine.

Geriatric ConsiderationsNot recommended for use in nonpsychotic patients (eg, dimentia-related psychotic symptoms). Studies in subjects >65 years of age have not been done. Orthostatic hypotension and sustained tachycardia have been noted in up to 25% of patients taking clozapine; therefore, elderly with cardiovascular disease may be at risk. The anticholinergic effects of clozapine may be prominent in elderly (eg, constipation, confusion, urinary retention).

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not seen in animal studies; however, there are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed. Healthcare providers are encouraged to enroll women 18-45 years of age exposed to clozapine during pregnancy in the Atypical Antipsychotics Pregnancy Registry (1-866-961-2388).

LactationEnters breast milk/not recommended (AAP rates “of concern”)

Adverse Reactions

>10%:

Cardiovascular: Tachycardia (25%)

Central nervous system: Drowsiness (39% to 46%), dizziness (19% to 27%), insomnia (2% to 20%)

Gastrointestinal: Constipation (14% to 25%), weight gain (4% to 31%), sialorrhea (31% to 48%), nausea/vomiting (3% to 17%)

1% to 10%:

Cardiovascular: Angina (1%), ECG changes (1%), hypertension (4%), hypotension (9%), syncope (6%)

Central nervous system: Akathisia (3%), seizure (3%), headache (7%), nightmares (4%), akinesia (4%), confusion (3%), myoclonic jerks (1%), restlessness (4%), agitation (4%), lethargy (1%), ataxia (1%), slurred speech (1%), depression (1%), anxiety (1%)

Dermatologic: Rash (2%)

Gastrointestinal: Abdominal discomfort/heartburn (4% to 14%), anorexia (1%), diarrhea (2%), xerostomia (6%), throat discomfort (1%)

Genitourinary: Urinary abnormalities (eg, abnormal ejaculation, retention, urgency, incontinence; 1% to 2%)

Hematologic: Eosinophilia (1%), leukopenia, leukocytosis, agranulocytosis (1%)

Hepatic: Liver function tests abnormal (1%)

Neuromuscular & skeletal: Tremor (6%), hypokinesia (4%), rigidity (3%), hyperkinesia (1%), weakness (1%), pain (1%), spasm (1%)

Ocular: Visual disturbances (5%)

Respiratory: Dyspnea (1%), nasal congestion (1%)

Miscellaneous: Diaphoresis increased, fever, tongue numbness (1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Amentia, amnesia, anemia, arrhythmia (atrial or ventricular), aspiration, blurred vision, bradycardia, bronchitis, cardiomyopathy (usually dilated), cataplexy, CHF, cholestasis, cyanosis, delusions, diabetes mellitus, difficult urination, edema, erythema multiforme, ESR increased, fecal impaction, gastroenteritis, granulocytopenia, hallucinations, hematemesis, hepatitis, hypercholesterolemia (rare), hyperglycemia, hypertriglyceridemia (rare), hyponatremia, hypothermia, impotence, interstitial nephritis (acute), intestinal obstruction, jaundice, loss of speech, MI, myasthenia syndrome, myocarditis, narrow-angle glaucoma, neuroleptic malignant syndrome, palpitations, pancreatitis (acute), paralytic ileus, Parkinsonism, pericardial effusion, pericarditis, phlebitis, pleural effusion, pneumonia, priapism, pulmonary embolism, rhabdomyolysis, rectal bleeding, salivary gland swelling, sepsis, status epilepticus, stroke, Stevens-Johnson syndrome, tardive dyskinesia, thrombocytopenia, thrombocytosis, thromboembolism, thrombophlebitis, vasculitis, wheezing

Metabolism/Transport Effects**Substrate** of CYP1A2 (major), 2A6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (weak), 2D6 (moderate), 2E1 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Atypical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Benzodiazepines: May enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Clozapine. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Clozapine. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nefazodone: May decrease the metabolism of Clozapine. *Risk C: Monitor therapy*

Omeprazole: May decrease the serum concentration of Clozapine. Omeprazole may increase the serum concentration of Clozapine. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Clozapine. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: St John's wort may decrease clozapine levels. Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersMental status, ECG, WBC (see below), vital signs, fasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually; BMI, personal/family history of obesity; waist circumference (weight should be assessed prior to treatment, at 4 weeks, 8 weeks, 12 weeks, and then at quarterly intervals. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of the initial weight); blood pressure; abnormal involuntary movement scale (AIMS).

WBC and ANC should be obtained at baseline and at least weekly for the first 6 months of continuous treatment. If counts remain acceptable (WBC ≥3500/mm^3, ANC ≥2000/mm^3) during this time period, then they may be monitored every other week for the next 6 months. If WBC/ANC continue to remain within these acceptable limits after the second 6 months of therapy, monitoring can be decreased to every 4 weeks. (**Note**: The decrease in monitoring to every 4 weeks is applicable in the United States. Blood monitoring requirements related to the use of clozapine have not changed in Canada). If clozapine is discontinued, a weekly WBC should be conducted for an additional 4 weeks or until WBC is ≥3500/mm^3 and ANC is ≥2000/mm^3. If clozapine therapy is interrupted due to moderate leukopenia, weekly WBC/ANC monitoring is required for 12 months in patients restarted on clozapine treatment. If therapy is interrupted for reasons other than leukopenia/granulocytopenia, the 6-month time period for initiation of biweekly WBCs may need to be reset. This determination depends upon the treatment duration, the length of the break in therapy, and whether or not an abnormal blood event occurred.

Consult full prescribing information for determination of appropriate WBC/ANC monitoring interval (http://www.clozaril.com/index.jsp).

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Initiate at lower doses and taper dosage slowly when discontinuing. Instruct patients with diabetes to monitor blood glucose levels closely (may cause hyperglycemia). Be alert to the potential of cardiac abnormalities. Monitor weight prior to initiating therapy and at least monthly. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of initial weight. Review ophthalmic exam periodically and assess results of weekly laboratory tests. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate administration, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsECG; WBC (see below), fasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually; BMI, personal/family history of obesity; waist circumference (weight should be assessed prior to treatment, at 4 weeks, 8 weeks, 12 weeks, and then at quarterly intervals.

WBC and ANC should be obtained at baseline and at least weekly for the first 6 months of continuous treatment. If counts remain acceptable (WBC ≥3500/mm^3, ANC ≥2000/mm^3) during this time period, then they may be monitored every other week for the next 6 months. If WBC/ANC continue to remain within these acceptable limits after the second 6 months of therapy, monitoring can be decreased to every 4 weeks. (**Note**: The decrease in monitoring to every 4 weeks is applicable in the United States. Blood monitoring requirements related to the use of clozapine have not changed in Canada). If clozapine is discontinued, a weekly WBC should be conducted for an additional 4 weeks or until WBC is ≥3500/mm^3 and ANC is ≥2000/mm^3. If clozapine therapy is interrupted due to moderate leukopenia, weekly WBC/ANC monitoring is required for 12 months in patients restarted on clozapine treatment. If therapy is interrupted for reasons other than leukopenia/granulocytopenia, the 6-month time period for initiation of biweekly WBCs may need to be reset. This determination depends upon the treatment duration, the length

of the break in therapy, and whether or not an abnormal blood event occurred.

Consult full prescribing information for determination of appropriate WBC/ANC monitoring interval (http://www.clozaril.com/index.jsp).

Patient EducationUse exactly as directed; do not increase dose or frequency. Do not discontinue this medication without consulting prescriber. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, monitor blood glucose levels frequently. You may experience headache, excess drowsiness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); constipation, diarrhea; dry mouth, nausea, vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing). You may be prone to infections; report fever, sore throat or other possible signs of infection. Report persistent CNS effects (insomnia, depression, altered consciousness); palpitations, rapid heartbeat, severe dizziness; vision changes; hypersalivation, tearing, sweating; respiratory difficulty; or worsening of condition. Report seizures, flu-like symptoms, chest pain, shortness of breath, or excessive fatigue. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 50 mg, 100 mg, 200 mg

Clozaril®: 25 mg [scored], 100 mg [scored]

Tablet, orally disintegrating:

FazaClo®: 12.5 mg [contains phenylalanine 0.87 mg/tablet; mint flavor], 25 mg [contains phenylalanine 1.74 mg/tablet; mint flavor], 100 mg [contains phenylalanine 6.96 mg/tablet; mint flavor]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Clozapine)

25 mg (60): $42.99

100 mg (60): $101.98

Mechanism of ActionClozapine (dibenzodiazepine antipsychotic) exhibits weak antagonism of D_1, D_2, D_3, and D_5 dopamine receptor subtypes, but shows high affinity for D_4; in addition, it blocks the serotonin ($5HT_2$), alpha-adrenergic, histamine H_1, and cholinergic receptors

Pharmacodynamics/Kinetics

Protein binding: 97% to serum proteins

Metabolism: Extensively hepatic; forms metabolites with limited or no activity

Bioavailability: 12% to 81% (not affected by food)

Half-life elimination: Steady state: 12 hours (range: 4-66 hours)

Time to peak: 2.5 hours (range: 1-6 hours)

Excretion: Urine (~50%) and feces (30%) with trace amounts of unchanged drug

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Sialorrhea and xerostomia (normal salivary flow resumes upon discontinuation). Many patients may experience orthostatic hypotension with clozapine; precautions should be taken; do not use atropine-like drugs for xerostomia in patients taking clozapine due to significant potentiation.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the local anesthesia procedure.

Mental Health: Child/Adolescent ConsiderationsEleven adolescents with childhood-onset schizophrenia who failed a 6-week trial of haloperidol were treated with clozapine (mean 6-week daily dose: 370 mg) (Frazier, 1994). Twenty-one patients (mean age: 14 ± 2.3 years) with schizophrenia (DSM-III-R) who had been nonresponsive to typical antipsychotics received clozapine 176 ± 149 mg/day (final dose) (Kumra, 1996). Clozapine was evaluated in 11 neuroleptic-resistant children (<13 years of age) mean dosage: 227 mg/day (Turetz, 1997). A 15-year old boy with severe treatment-refractory bipolar disorder type I was treated successfully with clozapine 300 mg/day (Masi, 1998).

Mental Health Comment

Clozapine is the prototype drug from the antipsychotic class often referred to as atypical. It should be noted that the definition of the term “atypical” is not universally agreed upon. Some prefer to describe antipsychotics based on their pharmacological properties. A common feature of all definitions used to describe “atypical” antipsychotics is the lack of significant acute or subacute EPS, at dosages generally associated with antipsychotic actions. Other experts have included definitions of atypicality that include a) failure to increase serum prolactin levels; b) superior efficacy for positive, negative, and cognitive symptoms; and c) lack of evidence of tardive dyskinesia or dystonia following chronic administration. Clozapine meets all of these criteria and therefore is considered the standard by which other atypical antipsychotics should be compared.

Recently, questions have been raised about its ability (as well as other atypical antipsychotics) to differentiate itself on negative symptom improvement. However, clozapine is considered the drug of choice for treating refractory schizophrenia. Refractory illness is often defined by “Kane” criteria in which patients have failed to respond to at least two antipsychotics from different chemical classes at 1000 mg of chlorpromazine or its equivalent (Kane, 1988).

In a recent trial, clozapine therapy demonstrated superiority over olanzapine therapy in preventing suicide attempts in patients with schizophrenia and schizoaffective disorder at high risk for suicide (Meltzer, 2003). The authors concluded that the use of clozapine for 2 years in this population should lead to a significant reduction in suicidal behavior.

Tardive dyskinesia (TD) secondary to **typical** antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. The incidence of TD associated with the atypical antipsychotics is estimated to be 0.5% to 1%. It is not clear if this estimate represents a risk associated with mental illness or to what extent drug therapy can be implicated. Clozapine appears less likely to cause tardive dyskinesia than typical antipsychotics (fluphenazine, haloperidol), but is generally associated with more weight gain and metabolic abnormalities such as diabetes.

Dose-dependent side effects associated with clozapine include seizures, tachycardia, and sedation.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Canadian Brand NamesBalnetar®; Estar®; Targel®

Pharmacologic CategoryTopical Skin Product

Use: Labeled IndicationsTopically for controlling dandruff, seborrheic dermatitis, or psoriasis

Dosing: Adults

Seborrhea, dermatitis: Topical:

Skin: Apply to the affected area 1-4 times/day; decrease frequency to 2-3 times/week once condition has been controlled

Soap: Use on affected areas in place of regular soap. Work into a lather using warm water; massage into skin; rinse.

Bath: Add appropriate amount to bath water, for adults usually 60-90 mL of a 5% to 20% solution or 15-25 mL of 30% lotion; soak 5-20 minutes, then pat dry; use once daily to 3 days

Dandruff: Shampoo: Rub shampoo onto wet hair and scalp, rinse thoroughly; repeat; leave on 5 minutes; rinse thoroughly; apply twice weekly for the first 2 weeks then once weekly or more often if needed

Psoriasis: Topical:

Scalp psoriasis: Tar oil bath or coal tar solution may be painted sparingly to the lesions 3-12 hours before each shampoo

Psoriasis of the body, arms, legs: Apply at bedtime; if thick scales are present, use product with salicylic acid and apply several times during the day

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to coal tar or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: May increase photosensitivity; avoid exposure to direct sunlight for 24 hours following application.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with eyes, genital/rectal areas.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined: Dermatologic: Dermatitis, folliculitis. irritation, photosensitivity

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream:

Fototar®: Coal tar 2% (85 g, 454 g)

Emulsion, topical:

Cutar®: Coal tar solution 7.5% (180 mL, 3840 mL)

Exorex®: Coal tar 1% (240 mL)

Gel, shampoo:

DHS™ Targel: Coal tar solution 2.9% (240 mL) [equivalent to coal tar 0.5%]

Liquid:

Doak® Tar Distillate: Coal tar 40% (60 mL) [for compounding use only]

Lotion, topical:

MG 217®: Coal tar solution 5% (120 mL) [equivalent to coal tar 1%; contains jojoba]

Oxipor® VHC: Coal tar solution 25% (60 mL, 120 mL) [equivalent to coal tar 5%; contains alcohol 79%]

Oil, topical:

Balnetar®: Coal tar 2.5% (225 mL) [for use in bath]

Doak® Tar: Coal tar distillate 2% (240 mL) [equivalent to coal tar 0.8%; for use in bath]

Ointment, topical:

MG 217®: Coal tar solution 10% (107 g, 430 g) [equivalent to coal tar 2%]

Shampoo, topical:

Betatar Gel®: Coal tar solution 5% (240 mL) [equivalent to coal tar 2.5%; green apple scent]

Denorex® Original Therapeutic Strength: Coal tar solution 12.5% (120 mL, 240 mL, 360 mL) [equivalent to coal tar 2.5%; available with or without conditioner]

DHS™ Tar: Coal tar solution 2.9% (120 mL, 240 mL, 480 mL) [equivalent to coal tar 0.5%]

Doak® Tar: Coal tar distillate 3% (240 mL) [equivalent to coal tar 1.2%]

Ionil T® Plus: Coal tar 2% (240 mL) [DSC]

MG 217® Medicated Tar: Coal tar solution 15% (120 mL, 240 mL) [equivalent to coal tar 3%]

Neutrogena® T/Gel: Coal tar 0.5% (132 mL, 255 mL, 480 mL)

Neutrogena® T/Gel Extra Strength: Coal tar extract 4% (132 mL) [coal tar 1%]

Neutrogena® T/Gel Stubborn Itch Control: Coal tar extract 2% (132 mL) [coal tar 0.5%]

Polytar®: Coal tar 0.5% (177 mL) [DSC]

Reme-T™: Coal tar 5% (236 mL)

Tera-Gel™: Solubilized coal tar 0.5% (120 mL, 240 mL)

Zetar®: Coal tar 1% (180 mL)

Soap, topical:

Polytar®: Coal tar 0.5% (113 g) [DSC]

Generic AvailableNo

Cocaine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(koe KANE)

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsTopical anesthesia for mucous membranes

Dosing: AdultsTopical application (ear, nose, throat, bronchoscopy): Dosage depends on the area to be anesthetized, tissue vascularity, technique of anesthesia, and individual patient tolerance; the lowest dose necessary to produce adequate anesthesia should be used; concentrations of 1% to 10% are used (not to exceed 1 mg/kg). Use reduced dosages for children, elderly, or debilitated patients.

Dosing: ElderlyRefer to adult dosing; use with caution.

Administration: TopicalUse only on mucous membranes of the oral, laryngeal, and nasal cavities. Do not use on extensive areas of broken skin.

StorageStore in well-closed, light-resistant containers.

RestrictionsC-II

ContraindicationsHypersensitivity to cocaine or any component of the topical solution; ophthalmologic anesthesia (causing sloughing of the corneal epithelium); pregnancy (nonmedicinal use)

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Disease-related concerns:

• Cardiovascular disease: Use with caution in patients with cardiovascular disease

• Cocaine abuse: Use with caution in patients with a history of cocaine abuse. In patients being treated for cardiovascular complication of cocaine abuse, avoid beta-blockers for treatment.

Special populations:

• Acutely ill patients: Use with caution in acutely ill; reduce dose consistent with age and physical status.

• Debilitated patients: Use with caution in debilitated patients; reduce dose consistent with age and physical status.

• Elderly: Use with caution in the elderly; reduce dose consistent with age and physical status.

• Pediatrics: Use with caution in children; reduce dose consistent with age and physical status.

Other warnings/precautions:

• Appropriate use: For topical use only. Limit to office and surgical procedures only. Use caution in patients with severely traumatized mucosa and sepsis in the region of the proposed application.

• Trained personnel: Clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC/X (nonmedicinal use)

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsIrritability, vomiting, diarrhea, tremors, and seizures have been reported in nursing infants.

Adverse Reactions

>10%:

Central nervous system: CNS stimulation

Gastrointestinal: Loss of taste perception

Respiratory: Rhinitis, nasal congestion

Miscellaneous: Loss of smell

1% to 10%:

Cardiovascular: Heart rate (decreased) with low doses, tachycardia with moderate doses, hypertension, cardiomyopathy, cardiac arrhythmia, myocarditis, QRS prolongation, Raynaud's phenomenon, cerebral vasculitis, thrombosis, fibrillation (atrial), flutter (atrial), sinus bradycardia, CHF, pulmonary hypertension, sinus tachycardia, tachycardia (supraventricular), arrhythmia (ventricular), vasoconstriction

Central nervous system: Fever, nervousness, restlessness, euphoria, excitation, headache, psychosis, hallucinations, agitation, seizure, slurred speech, hyperthermia, dystonic reactions, cerebral vascular accident, vasculitis, clonic-tonic reactions, paranoia, sympathetic storm

Dermatologic: Skin infarction, pruritus, madarosis

Gastrointestinal: Nausea, anorexia, colonic ischemia, spontaneous bowel perforation

Genitourinary: Priapism, uterine rupture

Hematologic: Thrombocytopenia

Neuromuscular & skeletal: Chorea (extrapyramidal), paresthesia, tremor, fasciculations

Ocular: Mydriasis (peak effect at 45 minutes; may last up to 12 hours), sloughing of the corneal epithelium, ulceration of the cornea, iritis, mydriasis, chemosis

Renal: Myoglobinuria, necrotizing vasculitis

Respiratory: Tachypnea, nasal mucosa damage (when snorting), hyposmia, bronchiolitis obliterans organizing pneumonia

Miscellaneous: “Washed-out” syndrome

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2D6 (strong), 3A4 (weak)
Drug Interactions

Cannabinoids: Cocaine may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Cocaine may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Monitoring ParametersVital signs
Reference RangeTherapeutic: 100-500 ng/mL (SI: 330 nmol/L); Toxic: >1000 ng/mL (SI: >3300 nmol/L)
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for interactions. Monitor adverse effects and teach patient adverse symptoms to report. **Pregnancy risk factor C/X (if nonmedicinal use).** Breast-feeding is contraindicated.
Patient EducationWhen used orally, do not take anything by mouth until full sensation returns. **Ocular:** Use caution when driving or engaging in tasks that require alert vision (mydriasis may last for several hours). At time of use or immediately thereafter, report any unusual cardiovascular, CNS, or respiratory symptoms. Following use, report skin irritation or eruption; alterations in vision, eye pain, or irritation; persistent GI effects; muscle or skeletal tremors, numbness, or rigidity; urinary or genital problems; or persistent fatigue. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Powder, for prescription compounding, as hydrochloride: 1 g, 5 g, 25 g

Solution, topical, as hydrochloride: 4% (4 mL, 10 mL); 10% (4 mL, 10 mL) [DSC]

Generic AvailableYes
Mechanism of ActionEster local anesthetic blocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction; interferes with the uptake of norepinephrine by adrenergic nerve terminals producing vasoconstriction
Pharmacodynamics/KineticsFollowing topical administration to mucosa:

Onset of action: ~1 minute

Peak effect: ~5 minutes

Duration (dose dependent): ≥30 minutes; cocaine metabolites may appear in urine of neonates up to 5 days after birth due to maternal cocaine use shortly before birth

Absorption: Well absorbed through mucous membranes; limited by drug-induced vasoconstriction; enhanced by inflammation

Distribution: Enters breast milk

Metabolism: Hepatic; major metabolites are ecgonine methyl ester and benzoyl ecgonine

Half-life elimination: 75 minutes

Excretion: Primarily urine (<10% as unchanged drug and metabolites)

Pharmacotherapy Pearls Cocaine intoxication of infants who are receiving breast milk from their mothers abusing cocaine has been reported.

Dental Health Professional Considerations The cocaine user, regardless of how the cocaine was administered, presents a potential life-threatening situation in the dental operatory. A patient under the influence of cocaine could be compared to a car going 100 mph. Blood pressure is elevated, heart rate is likely increased, and the use of a local anesthetic with epinephrine may result in a medical emergency. Such patients can be identified by their jitteriness, irritability, talkativeness, tremors, and short, abrupt speech patterns. These same signs and symptoms may also be seen in a normal dental patient with preoperative dental anxiety; therefore, the dentist must be particularly alert in order to identify the potential cocaine abuser. If cocaine use is suspected, the patient should never be given a local anesthetic with vasoconstrictor, for fear of exacerbating the cocaine-induced sympathetic response. Life-threatening episodes of cardiac arrhythmias and hypertensive crises have been reported when local anesthetic with vasoconstrictor was administered to a patient under the influence of cocaine. No local anesthetic, used by any dentist, can interfere with, nor test positive by cocaine in any urine testing screen. Therefore, the dentist does not need to be concerned with any false drug-use accusations associated with dental anesthesia.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Loss of taste perception. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Although plain local anesthetic is not contraindicated, vasoconstrictor is absolutely contraindicated in any patient under the influence of or within 2 hours of cocaine use

Mental Health: Effects on Mental StatusCNS stimulation is common; may cause exacerbation of psychosis, nervousness, euphoria, restlessness, hallucinations, paranoia

Mental Health: Effects on Psychiatric Treatment Concurrent use with MAO inhibitors may result in hypertensive crisis

Cardiovascular Considerations The prevalence of cocaine-induced cardiovascular events is increasing due to recreational use of cocaine. While cocaine is arrhythmogenic, it is also a potent vasospastic agent and may induce marked increases in blood pressure. In young patients presenting with acute myocardial infarction or with severe chest pain with ECG changes suggestive of ischemia, the possibility of antecedent cocaine use should be considered. Alpha blockade may be an option in treating cocaine-induced coronary artery spasm. Avoid use of beta-blockers in patients who are suspected of using cocaine. There is some evidence that the vasospastic effects of cocaine may be enhanced when the drug is used in association with nicotine consumption. Cocaine may also be associated with cerebral vascular accidents in young patients without any previous risk factors.

Anesthesia and Critical Care Concerns/Other Considerations Cocaine may also be associated with cerebral vascular accidents in young patients without any previous risk factors.

Index Terms Cocaine Hydrochloride

Tylenol® With Codeine: Health Canada Issues Warning Concerning Potentially Increased Morphine Levels In Milk of Nursing Mothers - October 9, 2008

Janssen-Ortho Inc, in conjunction with Health Canada, has issued a “Dear Healthcare Professional” letter concerning use of Tylenol® with Codeine (acetaminophen with codeine) products and the risk of elevated morphine levels in the serum and breast milk of nursing women who are ultra-rapid metabolizers of codeine. Consequently, infants of nursing mothers with a certain CYP2D6 (converts codeine to morphine) genotype, may be exposed to potentially dangerous serum levels of morphine as well.

Available data indicates the incidence of this CYP2D6 genotype in the general population varies and is estimated to occur in the following populations as follows: North African, Ethiopian, and Arab (16% to 28%); Chinese, Japanese, and Hispanic (0.5% to 1%); Caucasian (1% to 10%); African American (3%).

When using codeine in nursing women, healthcare providers are urged to prescribe and administer the lowest possible dose for the shortest time necessary to achieve adequate clinical effect. Nursing women should be advised of signs/symptoms of morphine toxicity for themselves (extreme sedation, confusion, shallow breathing) and for their infants (sedation, dyspnea, decreased tone, difficult breastfeeding). The manufacturer will be updating the product labeling to include these new warnings and precautions. A similar warning had previously been released in the U.S. in August 2007.

Additional information can be found at the following websites:

Canada: http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/tylenol_codeine_hpc-cps-eng.php

U.S.: http://www.fda.gov/cder/drug/InfoSheets/HCP/codeineHCP.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Codeine may be confused with Cardene®, Cophene®, Cordran®, iodine, Lodine®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(KOE deen)

Canadian Brand NamesCodeine Contin®

Pharmacologic CategoryAnalgesic, Opioid; Antitussive

Use: Labeled IndicationsTreatment of mild-to-moderate pain; antitussive in lower doses; dextromethorphan has equivalent antitussive activity but has much lower toxicity in accidental overdose

Use: DentalTreatment of postoperative pain

Dosing: Adults**Note:** These are guidelines and do not represent the maximum doses that may be required in all patients. Doses should be titrated to pain relief/prevention. Doses >1.5 mg/kg body weight are not recommended.

Pain management (analgesic):

Oral, regular release: 30 mg every 4-6 hours as needed; patients with prior opiate exposure may require higher initial doses. Usual range: 15-120 mg every 4-6 hours as needed

Oral, controlled release formulation (Codeine Contin®, not available in U.S.): 50-300 mg every 12 hours. **Note:** A patient's codeine requirement should be established using prompt release formulations; conversion to long acting products may be considered when chronic, continuous treatment is required. Higher dosages should be reserved for use only in opioid-tolerant patients.

I.M., SubQ: 30 mg every 4-6 hours as needed; patients with prior opiate exposure may require higher initial doses. Usual range: 15-120 mg every 4-6 hours as needed; more frequent dosing may be needed

Cough (antitussive): Oral (for nonproductive cough): 10-20 mg/dose every 4-6 hours as needed; maximum: 120 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** These are guidelines and do not represent the maximum doses that may be required in all patients. Doses should be titrated to pain relief/prevention. Doses >1.5 mg/kg body weight are not recommended.

Analgesic: Oral, I.M., SubQ: Children: 0.5-1 mg/kg/dose every 4-6 hours as needed; maximum: 60 mg/dose

Antitussive: Oral (for nonproductive cough): Children: 1-1.5 mg/kg/day in divided doses every 4-6 hours as needed: Alternative dose according to age:

2-6 years: 2.5-5 mg every 4-6 hours as needed; maximum: 30 mg/day

6-12 years: 5-10 mg every 4-6 hours as needed; maximum: 60 mg/day

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer 75% of dose.

Cl_{cr} <10 mL/minute: Administer 50% of dose.

Dosing: Hepatic ImpairmentDosing adjustment is probably necessary in hepatic insufficiency.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Fentanyl Transdermal Conversion
- Opioid Agonist Conversion

Administration: I.V. DetailpH: 3-6 (codeine phosphate)

StorageStore injection between 15°C to 30°C; avoid freezing. Do not use if injection is discolored or contains a precipitate. Protect injection from light.

Compatibility**Compatibility in syringe: Compatible:** Glycopyrrolate, hydroxyzine.

RestrictionsC-II

ContraindicationsHypersensitivity to codeine or any component of the formulation; pregnancy (prolonged use or high doses at term)

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with severe renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- CYP2D6 “ultra-rapid metabolizers”: Use caution in patients with two or more copies of the variant CYP2D6*2 allele; may have extensive conversion to morphine and thus increased opioid-mediated effects.

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy have not been established for antitussive use in children <2 years of age.

Dosage form specific issues:

- Sulfites: Some preparations contain sulfites which may cause allergic reactions.

Other warnings/precautions:

- Cough control: Not recommended for use for cough control in patients with a productive cough.

- I.V. administration: Not approved for I.V. administration (although this route has been used clinically). If given intravenously, must be given slowly and the patient should be lying down. Rapid intravenous administration of narcotics may increase the incidence of serious adverse effects, in part due to limited opportunity to assess response prior to administration of the full dose. Access to respiratory support should be immediately available.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsThe elderly may be particularly susceptible to CNS depression and confusion as well as the constipating effects of narcotics.

Pregnancy Risk FactorC/D (prolonged use or high doses at term)

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Neonatal abstinence syndrome (NAS) has been observed in the newborn following maternal use of codeine during pregnancy. Symptoms of opiate withdrawal may include excessive crying, diarrhea, fever, hyperreflexia, irritability, tremors, or vomiting. Perinatal stroke has also been reported.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsCodeine and its metabolite (morphine) are found in breast milk and can be detected in the serum of nursing infants. The relative dose to a nursing infant has been calculated to be ~1% of the weight-adjusted maternal dose. Higher levels of morphine may be found in the breast milk of lactating mothers who are “ultra-rapid metabolizers” of codeine; patients with two or more copies of the variant CYP2D6*2 allele may have extensive conversion to morphine and thus increased opioid-mediated effects. In one case, excessively high serum concentrations of morphine were reported in a breastfed infant following maternal use of acetaminophen with codeine. The mother was later found to be an “ultra-rapid metabolizer” of codeine; symptoms in the infant included feeding difficulty and lethargy, followed by death. Because exposure to the nursing infant is generally low, the AAP considers codeine to be “usually compatible with breast-feeding”. However, caution should be used since most persons are not aware if they have the genotype resulting in “ultra-rapid metabolizer” status. When codeine is used in breast-feeding women, it is recommended to use the lowest dose for the shortest duration of time and observe the infant for increased sleepiness, difficulty in feeding or breathing, or limpness.

Adverse Reactions

Frequency not defined: ALT increased, AST increased

>10%:

Central nervous system: Drowsiness

Gastrointestinal: Constipation

1% to 10%:

Cardiovascular: Hypotension, tachycardia or bradycardia

Central nervous system: Confusion, dizziness, false feeling of well being, headache, lightheadedness, malaise, paradoxical CNS stimulation, restlessness

Dermatologic: Rash, urticaria

Gastrointestinal: Anorexia, nausea, vomiting, xerostomia

Genitourinary: Ureteral spasm, urination decreased

Hepatic: LFTs increased

Local: Burning at injection site

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision

Respiratory: Dyspnea

Miscellaneous: Histamine release

<1%: Biliary spasm, convulsions, hallucinations, insomnia, mental depression, muscle rigidity, nightmares, paralytic ileus, stomach cramps

Oncology: VesicantNo

Metabolism/Transport Effects**Substrate** of CYP2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (may increase CNS depression).

Herb/Nutraceutical: St John's wort may decrease codeine levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered.

Monitoring ParametersPain relief, respiratory and mental status, blood pressure, heart rate

Reference RangeTherapeutic: Not established; Toxic: >1.1 mcg/mL

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for possible additive or adverse interactions. Monitor for effectiveness of pain relief, for signs of overdose, vital signs and CNS status, and adverse reactions at beginning of therapy and at regular intervals with long-term use. May cause physical and/or psychological dependence. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered). Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness, drowsiness, confusion, agitation, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); nausea or vomiting, or loss of appetite (frequent mouth care, small frequent meals, sucking lozenges, or chewing gum may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). Report confusion, insomnia, excessive nervousness, excessive sedation or drowsiness, or shakiness; acute GI upset; respiratory difficulty or shortness of breath; facial flushing, rapid heartbeat, or palpitations; urinary difficulty; unusual muscle weakness; or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if you are breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, as phosphate: 15 mg/mL (2 mL); 30 mg/mL (2 mL) [contains sodium metabisulfite]

Powder, for prescription compounding: 10 g, 25 g

Tablet, as phosphate: 30 mg, 60 mg

Tablet, as sulfate: 15 mg, 30 mg, 60 mg

Tablet, controlled release (Codeine Contin®) [CAN]: 50 mg, 100 mg, 150 mg, 200 mg [not available in U.S.]

Generic AvailableYes

Mechanism of ActionBinds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; causes cough supression by direct central action in the medulla; produces generalized CNS depression

Pharmacodynamics/Kinetics

Onset of action: Oral: 0.5-1 hour; I.M.: 10-30 minutes

Peak effect: Oral: 1-1.5 hours; I.M.: 0.5-1 hour

Duration: 4-6 hours

Absorption: Oral: Adequate

Distribution: Crosses placenta; enters breast milk

Protein binding: 7%

Metabolism: Hepatic to morphine (active)

Half-life elimination: 2.5-3.5 hours

Excretion: Urine (3% to 16% as unchanged drug, norcodeine, and free and conjugated morphine)

Related Information

- Narcotic / Opioid Analgesics

Dental Health Professional ConsiderationsIt is recommended that codeine not be used as the sole entity for analgesia because of moderate efficacy along with relatively high incidence of nausea, sedation, and constipation. In addition, codeine has some narcotic addiction liability. Codeine in combination with acetaminophen or aspirin is recommended. Maximum effective analgesic dose of codeine is 60 mg (1 grain). Beyond 60 mg increases respiratory depression only. Sodium thiosulfate is an effective chemical antidote for codeine poisoning.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause euphoria, confusion, insomnia, hallucinations, or depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive toxicity; concurrent use with fluoxetine or paroxetine may result in loss of pain control

Cardiovascular ConsiderationsCodeine may cause constipation which may be problematic in patients with unstable angina, and patients after myocardial infarction. The hemodynamic responses to valsalva-like maneuvers due to straining may have adverse cardiovascular consequences in patients with critical coronary artery disease.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) recommend against using codeine because of its lack of potency, histamine release (may cause hypotension), potential accumulation of active metabolites. The guidelines recommend fentanyl in patients who need immediate pain relief because of its rapid onset of action; fentanyl or hydromorphone is preferred in patients who are hypotensive or have renal dysfunction. Morphine or hydromorphone is recommended for intermittent, scheduled therapy. Both have a longer duration of action requiring less frequent administration.

Index TermsCodeine Phosphate; Codeine Sulfate; Methylmorphine

Cyclophosphamide: I.V.: 800 mg/m^2/day days 1 and 2

[total dose/cycle = 1600 mg/m^2]

Vincristine: I.V.: 1.4 mg/m^2/day (maximum 2 mg) days 1 and 10

[total dose/cycle = 2.8 mg/m^2; maximum 4 mg/cycle]

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Methotrexate: I.V.: 3 g/m^2 day 10

[total dose/cycle = 3 g/m^2]

Leucovorin: I.V.: 200 mg/m^2 day 11

followed by Oral, I.V.: 15 mg/m^2 every 6 hours until methotrexate level <0.1 Mmol/L

Cytarabine: I.T.: 50 mg/day days 1 and 3

[total dose/cycle = 100 mg]

Methotrexate: I.T.: 12 mg day 1

[total dose/cycle = 12 mg]

Filgrastim: SubQ: Dose not specified, days 3 to 8 and day 12 until ANC >1000 cells/mm^3

Cycle alternates with IVAC (cycles begin when ANC >1000 cells/mm^3)

Note: Hydrocortisone 50 mg may be added to intrathecal therapy to reduce the incidence of side effects/chemical arachnoiditis.

IVAC

Ifosfamide: I.V.: 1500 mg/m^2/day days 1 to 5

[total dose/cycle = 7500 mg/m^2]

Mesna: I.V.: 1500 mg/m^2/day (in divided doses) days 1 to 5

[total dose/cycle = 7500 mg/m^2]

Etoposide: I.V.: 60 mg/m^2/day days 1 to 5

[total dose/cycle = 300 mg/m^2]

Cytarabine: I.V.: 2 g/m^2 every 12 hours, for 4 doses, days 1 and 2

[total dose/cycle = 8 g/m^2]

Methotrexate: I.T.: 12 mg day 5

[total dose/cycle = 12 mg]

Filgrastim: SubQ: Dose not specified, day 6 until ANC >1000 cells/mm^3

Cycle alternates with CODOX-M (cycles begin when ANC >1000 cells/mm^3)

Note: Hydrocortisone 50 mg may be added to intrathecal therapy to reduce the incidence of side effects/chemical arachnoiditis.

Colchicine and Probenecid

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(KOL chi seen & proe BEN e sid)

Pharmacologic CategoryAnti-inflammatory Agent; Antigout Agent; Uricosuric Agent

Use: Labeled IndicationsTreatment of chronic gouty arthritis when complicated by frequent, recurrent acute attacks of gout

Dosing: AdultsGout: Oral: 1 tablet/day for 1 week, then 1 tablet twice daily thereafter

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentProbenecid may not be effective in patients with chronic renal insufficiency particularly when Cl_{cr} is â¤30 mL/minute.

Administration: OralDo not initiate therapy until acute attack has subsided.

ContraindicationsHypersensitivity to colchicine, probenecid, or any component of the formulation

Allergy Considerations

- Colchicine Allergy

Geriatric ConsiderationsRefer to individual agents.

Pregnancy Risk FactorC

Lactation

Colchicine: Compatible

Probenecid: Excretion in breast milk unknown

Adverse Reactions1% to 10%:

Cardiovascular: Flushing

Central nervous system: Headache, dizziness

Dermatologic: Rash, alopecia

Gastrointestinal: Anorexia, nausea, vomiting, diarrhea, abdominal pain

Hematologic: Anemia, leukopenia, aplastic anemia, agranulocytosis

Hepatic: Hepatic necrosis, hepatotoxicity

Neuromuscular & skeletal: Peripheral neuritis, myopathy

Renal: Nephrotic syndrome, uric acid stones, polyuria

Miscellaneous: Hypersensitivity reactions

Metabolism/Transport Effects

Colchicine: **Substrate** of CYP3A4 (major); **Induces** CYP2C8 (weak), 2C9 (weak), 2E1 (weak), 3A4 (weak)

Probenecid: **Inhibits** CYP2C19 (weak)

Drug Interactions

Carbapenems: Uricosuric Agents may decrease the excretion of Carbapenems. Management: Avoid concomitant use of doripenem and probenecid. *Risk C: Monitor therapy*

Cephalosporins: Uricosuric Agents may decrease the excretion of Cephalosporins. **Exceptions:** Ceftobiprole. *Risk C: Monitor therapy*

CycloSPORINE: May enhance the adverse/toxic effect of Colchicine. These include hepatotoxicity and myopathies. Colchicine may increase the serum concentration of CycloSPORINE. Nephrotoxicity and hepatotoxicity may also be increased. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dapsone: Uricosuric Agents may decrease the excretion of Dapsone. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Doripenem: Probenecid may increase the serum concentration of Doripenem. This effect is due to probenecid's ability to decrease the active tubular secretion of doripenem. *Risk D: Consider therapy modification*

Gemifloxacin: Probenecid may decrease the excretion of Gemifloxacin. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Colchicine may enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Ketoprofen: Probenecid may increase the serum concentration of Ketoprofen. *Risk C: Monitor therapy*

Ketorolac: Probenecid may increase the serum concentration of Ketorolac. *Risk X: Avoid combination*

LORazepam: Probenecid may decrease the metabolism of LORazepam. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of Colchicine. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Uricosuric Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Mycophenolate: Probenecid may increase the serum concentration of Mycophenolate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: Probenecid may increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Penicillins: Uricosuric Agents may decrease the excretion of Penicillins. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Quinolone Antibiotics: Probenecid may increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: May diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Sodium Benzoate: Probenecid may increase the serum concentration of Sodium Benzoate. Specifically, probenecid may inhibit the renal transport of the hippuric acid metabolite of sodium benzoate. *Risk C: Monitor therapy*

Sodium Phenylacetate: Probenecid may increase the serum concentration of Sodium Phenylacetate. Specifically, probenecid may inhibit the renal transport of the phenylacetylglutamine metabolite of sodium phenylacetate. *Risk C: Monitor therapy*

Theophylline Derivatives: Uricosuric Agents may decrease the excretion of Theophylline Derivatives. **Exceptions:** Aminophylline; Theophylline. *Risk C: Monitor therapy*

Verapamil: May enhance the nephrotoxic effect of Colchicine. Colchicine may increase the serum concentration of Verapamil. *Risk C: Monitor therapy*

Zidovudine: Probenecid may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Colchicine 0.5 mg and probenecid 0.5 g

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Colchicine-Probenecid)

0.5-500 mg (30): $25.99

Pharmacodynamics/KineticsSee individual agents.
Related Information

- Colchicine
- Probenecid

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness
Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis; use caution with clozapine and carbamazepine; CNS depressant effects may be enhanced

Special Alerts

Intravenous Colchicine: U.S. Food and Drug Administration (FDA) Enforcement Action Injectable Product - February 6, 2008

The FDA has ordered companies to stop manufacturing injectable colchicine within 30 days and to stop shipping the product within 180 days. After these dates, all injectable colchicine products must have FDA approval in order to be manufactured or shipped interstate. Injectable colchicine has a narrow therapeutic index and most related toxicities are dose-related. The FDA wants to ensure safety and efficacy of the intravenous product as it has been “grandfathered” into use which did not require evaluation of these endpoints. Serious safety concerns have been associated with intravenous colchicine use; 50 reports of serious adverse events have been reported, including 23 deaths (through June, 2007). Three of these deaths were associated with the use of an improperly compounded I.V. colchicine used to treat chronic back pain, not an accepted practice (*MMWR*, 2007).

Recently (October 2007), the only manufacturer of injectable colchicine voluntarily discontinued production. The FDA also strongly discourages the compounding of injectable colchicine due to serious safety risks. Oral colchicine tablets are not affected by this action.

Additional information can be found at http://www.fda.gov/cder/drug/unapproved_drugs/colchicine_qa.htm.

Medication Safety Issues

Sound-alike/look-alike issues:

Colchicine may be confused with Cortrosyn®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(KOL chi seen)

Pharmacologic CategoryColchicine

Use: Labeled IndicationsTreatment of acute gouty arthritis attacks and prevention of recurrences of such attacks

Use: Unlabeled/InvestigationalPrimary biliary cirrhosis; management of familial Mediterranean fever; pericarditis

Dosing: Adults

Familial Mediterranean fever (unlabeled use): Prophylaxis: Oral: 1-2 mg daily in divided doses (occasionally reduced to 0.6 mg/day in patients with GI intolerance)

Gouty arthritis:

Prophylaxis of acute attacks: Oral: 0.6 mg twice daily; initial and/or subsequent dosage may be decreased (ie, 0.6 mg once daily) in patients at risk of toxicity or in those who are intolerant (including weakness, loose stools, or diarrhea); range: 0.6 mg every other day to 0.6 mg 3 times/day

Acute attacks:

Oral: Initial: 0.6-1.2 mg, followed by 0.6 every 1-2 hours; some clinicians recommend a maximum of 3 doses; more aggressive approaches have recommended a maximum dose of up to 6 mg. Wait at least 3 days before initiating another course of therapy

I.V.: Initial: 1-2 mg, then 0.5 mg every 6 hours until response, not to exceed total dose of 4 mg. If pain recurs, it may be necessary to administer additional daily doses. The amount of colchicine administered intravenously in an acute treatment period (generally ~1 week) should not exceed a total dose of 4 mg. Do not administer more colchicine by any route for at least 7 days after a full course of I.V. therapy.

Note: Many experts would avoid use because of potential for serious, life-threatening complications. Should not be administered to patients with renal insufficiency, hepatobiliary obstruction, patients >70 years of age, or recent oral colchicine use. Should be reserved for hospitalized patients who are under the care of a physician experienced in the use of intravenous colchicine.

Surgery: Gouty arthritis, prophylaxis of recurrent attacks: Oral: 0.6 mg/day or every other day; patients who are to undergo surgical procedures may receive 0.6 mg 3 times/day for 3 days before and 3 days after surgery

Primary biliary cirrhosis (unlabeled use): Oral: 0.6 mg twice daily

Pericarditis (unlabeled use): Oral: 0.6 mg twice daily

Dosing: ElderlyRefer to adult dosing. Reduce maintenance/prophylactic dose by 50% in individuals >70 years.

Dosing: PediatricProphylaxis of familial Mediterranean fever (unlabeled use): Oral:

Children ≤5 years: 0.5 mg/day

Children >5 years: 1-1.5 mg/day in 2-3 divided doses

Dosing: Renal Impairment

Gouty arthritis, acute attacks: Oral: Specific dosing recommendations not available from the manufacturer:

Prophylaxis:

Cl_{cr} 35-49 mL/minute: 0.6 mg once daily

Cl_{cr} 10-34 mL/minute: 0.6 mg every 2-3 days

Cl_{cr} <10 mL/minute: Avoid chronic use of colchicine. Use in serious renal impairment is contraindicated by the manufacturer.

Treatment: Cl_{cr} <10 mL/minute: Use in serious renal impairment is contraindicated by the manufacturer. If a decision is made to use colchicine, decrease dose by 75%.

Peritoneal dialysis: Supplemental dose is not necessary

Dosing: Hepatic ImpairmentAvoid in hepatobiliary dysfunction and in patients with hepatic disease.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Injection should be made over 2-5 minutes into tubing of free-flowing I.V. with compatible fluid. Do not administer I.M. or SubQ; severe local irritation can occur following SubQ or I.M. administration. Extravasation can cause tissue irritation.

Administration: OralAdminister tablet orally with water and maintain adequate fluid intake.

Dietary ConsiderationsMay need to supplement with vitamin B_{12}.

StorageProtect tablets from light.

CompatibilityI.V. colchicine is **incompatible** with dextrose or I.V. solutions with preservatives.

ContraindicationsHypersensitivity to colchicine or any component of the formulation; severe renal, gastrointestinal, hepatic, or cardiac disorders; blood dyscrasias; pregnancy (parenteral)

Allergy Considerations

- Colchicine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Gastrointestinal symptoms: Dosage reduction is recommended in patients who develop gastrointestinal symptoms (anorexia, diarrhea, nausea, vomiting) related to drug therapy.

- Local irritation: Severe local irritation can occur following SubQ or I.M. administration; do not administer by these routes.

- Weakness: Dosage reduction is recommended in patients who develop weakness related to drug therapy.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with mild-to-moderate cardiac disease.

- Hepatic impairment: Use with caution in patients with mild-to-moderate hepatic impairment; do not administer I.V. in patients with hepatobiliary obstruction.

- Renal impairment: Use with caution in patients with mild-to-moderate renal impairment; I.V. form should not be administered.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- I.V. administration: Use only with extreme caution; potential for serious, life-threatening complications. Should not be administered to patients with renal insufficiency, hepatobiliary obstruction, patients >70 years of age, or recent oral colchicine use. Should be reserved for hospitalized patients who are under the care of a physician experienced in the use of intravenous colchicine.

Geriatric ConsiderationsColchicine appears to be more toxic in older adults, particularly in the presence of renal, gastrointestinal, or cardiac disease. The most predictable oral side effects are gastrointestinal (eg, vomiting, abdominal pain, and nausea). If colchicine is stopped at this point, other more severe adverse effects may be avoided, such as bone marrow suppression, peripheral neuritis, etc.

Pregnancy Risk FactorC (oral); D (parenteral)

LactationEnters breast milk/use caution (AAP rates “compatible”)

Adverse Reactions

>10%: Gastrointestinal: Nausea, vomiting, diarrhea, abdominal pain

1% to 10%:

Dermatologic: Alopecia

Gastrointestinal: Anorexia

<1%: Agranulocytosis, aplastic anemia, arrhythmia (with intravenous administration), azoospermia, bone marrow suppression, dermatosis, hepatotoxicity, hypersensitivity reaction, myopathy, peripheral neuritis, purpura, rash

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Induces** CYP2C8 (weak), 2C9 (weak), 2E1 (weak), 3A4 (weak)

Drug Interactions

CycloSPORINE: May enhance the adverse/toxic effect of Colchicine. These include hepatotoxicity and myopathies. Colchicine may increase the serum concentration of CycloSPORINE. Nephrotoxicity and hepatotoxicity may also be increased. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Colchicine may enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of Colchicine. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Verapamil: May enhance the nephrotoxic effect of Colchicine. Colchicine may increase the serum concentration of Verapamil. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol.

Food: Cyanocobalamin (vitamin B_{12}): Malabsorption of the substrate. May result in macrocytic anemia or neurologic dysfunction.

Herb/Nutraceutical: Vitamin B_{12} absorption may be decreased by colchicine.

Test InteractionsMay cause false-positive results in urine tests for erythrocytes or hemoglobin

Monitoring ParametersCBC and renal function test

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. **I.V.:** Monitor therapeutic effectiveness, laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC and renal function on a regular basis

Patient EducationTake as directed; do not exceed recommended dosage. Consult prescriber about a low-purine diet. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol or aspirin-containing medication without consulting prescriber. You may experience nausea, vomiting, or anorexia (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); hair loss (reversible). Stop medication and report to prescriber if severe vomiting, watery or bloody diarrhea, or abdominal pain occurs. Report muscle tremors or weakness; fatigue; easy bruising or bleeding; yellowing of eyes or skin; or pale stool or dark urine. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 0.5 mg/mL (2 mL)

Tablet: 0.6 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Colchicine)

0.6 mg (30): $12.99

Mechanism of ActionDecreases leukocyte motility, decreases phagocytosis in joints and lactic acid production, thereby reducing the deposition of urate crystals that perpetuates the inflammatory response

Pharmacodynamics/Kinetics

Onset of action: Oral: Pain relief: ~12 hours if adequately dosed

Distribution: Concentrates in leukocytes, kidney, spleen, and liver; does not distribute in heart, skeletal muscle, and brain

Protein binding: 10% to 31%

Metabolism: Partially hepatic via deacetylation

Half-life elimination: 12-30 minutes; End-stage renal disease: 45 minutes

Time to peak, serum: Oral: 0.5-2 hours, declining for the next 2 hours before increasing again due to enterohepatic recycling

Excretion: Primarily feces; urine (10% to 20%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness
Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis; use caution with clozapine and carbamazepine; CNS depressant effects may be enhanced

Colesevelam

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(koh le SEV a lam)
U.S. Brand NamesWelChol®
Canadian Brand NamesWelChol®
Pharmacologic CategoryAntilipemic Agent, Bile Acid Sequestrant
Use: Labeled IndicationsManagement of elevated LDL in primary hypercholesterolemia (Fredrickson type IIa) when used alone or in combination with an HMG-CoA reductase inhibitor; improve control of type 2 diabetes mellitus (noninsulin dependent, NIDDM) in conjunction with insulin or oral antidiabetic agents
Dosing: Adults

Dyslipidemia: Oral: 3 tablets twice daily with meals or 6 tablets once daily with a meal

Type 2 diabetes:*Combination therapy with insulin or oral antibiabetic agents:* 3 tablets twice daily with meals or 6 tablets once daily with a meal

Dosing: ElderlyRefer to adult dosing.
Administration: OralAdminister with meal(s) and a liquid. Make sure patient understands dietary guidelines.
Dietary ConsiderationsShould be taken with meal(s) and a liquid. Follow dietary guidelines.
StorageStore at room temperature. Protect from moisture.
ContraindicationsHistory of bowel obstruction; serum triglyceride concentration >500 mg/dL; history of hypertriglyceridemia-induced pancreatitis
Warnings/Precautions

Disease-related concerns:

- Gastrointestinal disease: Use with caution in patients with dysphagia, swallowing disorders, severe GI motility disorders or major GI tract surgery.

- Hypertriglyceridemia: Use with caution in treating patients with serum triglyceride concentrations >300 mg/dL (may cause increased concentrations). Discontinue if triglyceride concentrations exceed 500 mg/dL or hypertriglyceridemia-induced pancreatitis occurs.

- Patients susceptible to fat-soluble vitamin deficiencies: Use with caution in patients susceptible to fat-soluble vitamin deficiencies.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy. Minimal effects are seen on HDL-C and triglyceride concentrations.

- Appropriate use: Colesevlam is not indicated for the management of type 1 diabetes mellitus (insulin dependent, IDDM), particularly in the acute management (eg, DKA). It is also not indicated as monotherapy and must be used as an adjunct to insulin or oral antidiabetic agents.

Geriatric ConsiderationsThe definition of and, therefore, when to treat hyperlipidemia in elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Elderly with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.
Pregnancy Risk FactorB
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women; use only in pregnancy if clearly needed.
LactationExcretion in breast milk unknown
Adverse Reactions

>10%: Gastrointestinal: Constipation (11%)

2% to 10%:

Gastrointestinal: Dyspepsia (8%)

Neuromuscular & skeletal: Weakness (4%), myalgia (2%)

Respiratory: Pharyngitis (3%)

Incidence less than or equal to placebo: Infection, headache, pain, back pain, abdominal pain, flu syndrome, flatulence, diarrhea, nausea, sinusitis, rhinitis, cough

Drug Interactions

Amiodarone: Bile Acid Sequestrants may decrease the bioavailability of Amiodarone. *Risk D: Consider therapy modification*

Antidiabetic Agents (Thiazolidinedione): Bile Acid Sequestrants may decrease the absorption of Antidiabetic Agents (Thiazolidinedione). *Risk D: Consider therapy modification*

Calcitriol: Bile Acid Sequestrants may decrease the serum concentration of Calcitriol. *Risk C: Monitor therapy*

Corticosteroids (Oral): Bile Acid Sequestrants may decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Ethinyl Estradiol: Colesevelam may decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Ezetimibe: Bile Acid Sequestrants may decrease the absorption of Ezetimibe. *Risk C: Monitor therapy*

GlyBURIDE: Colesevelam may decrease the serum concentration of GlyBURIDE. *Risk D: Consider therapy modification*

Loop Diuretics: Bile Acid Sequestrants may decrease the absorption of Loop Diuretics. *Risk D: Consider therapy modification*

Methotrexate: Bile Acid Sequestrants may decrease the absorption of Methotrexate. *Risk C: Monitor therapy*

Niacin: Bile Acid Sequestrants may decrease the absorption of Niacin. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: Bile Acid Sequestrants may decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Norethindrone: Colesevelam may decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Phenytoin: Colesevelam may decrease the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Raloxifene: Bile Acid Sequestrants may decrease the absorption of Raloxifene. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Bile Acid Sequestrants may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Thiazide Diuretics: Bile Acid Sequestrants may decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Thyroid Products: Bile Acid Sequestrants may decrease the absorption of Thyroid Products. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Bile Acid Sequestrants may decrease the absorption of Vitamin K Antagonists. *Risk C: Monitor therapy*

Monitoring ParametersSerum cholesterol, LDL, and triglyceride levels should be obtained before initiating treatment and periodically thereafter (in accordance with NCEP guidelines)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests prior to and on a regular basis during therapy. Assess knowledge/teach patient appropriate use, possible adverse reactions and interventions, and symptoms to report.

Monitoring: Lab TestsSerum cholesterol, LDL, and triglyceride levels should be obtained before initiating treatment and periodically thereafter (in accordance with NCEP guidelines).

Patient EducationTake medication exactly as directed; do not alter dosage without consulting prescriber. Other medications should be taken 1 hour before or 4 hours after colesevelam. You may experience constipation (increased exercise, increased exercise, fluids, fruit, fiber, or stool softener may help). Report persistent GI upset, skeletal or muscle pain or weakness, or respiratory difficulties. **Breast-feeding precaution:** Inform prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride:

WelChol®: 625 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (WelChol)

625 mg (60): $78.05

Mechanism of ActionColesevelam binds bile acids including glycocholic acid in the intestine, impeding their reabsorption. Increases the fecal loss of bile salt-bound LDL-C

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Therapeutic: ~2 weeks

Absorption: Insignificant

Excretion: Urine (0.05%) after 1 month of chronic dosing

Related Information

- Hyperlipidemia Management
- Lipid-Lowering Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Constipation is common, concurrent use with psychotropic agents may exacerbate this effect

Cardiovascular Considerations Colesevelam may be 4-6 times as potent as traditional bile acid sequestrants, perhaps because of its greater binding affinity for glycocholic acid (Steinmetz, 2002). Unlike cholestyramine and colestipol, colesevelam appears to reduce LDL cholesterol in a dose-dependent manner. Bile acid sequestrants can cause an undesirable increase in serum triglycerides. No trials are available comparing colesevelam to cholestyramine or colestipol. Colesevelam does not interfere with intestinal absorption of fat-soluble vitamins. Can be taken concurrently with a HMG-CoA reductase inhibitor.

Anesthesia and Critical Care Concerns/Other Considerations Colesevelam alone or when combined with a statin is effective in lowering cholesterol. Colesevelam may increase triglycerides; therefore, it should be used with caution or avoided in patients with triglyceride levels ≥200 mg/dL. Systemic toxicity is low since the drug is not absorbed.

Jump To Field (Select Field Name)

Pronunciation(koe LES ti pole)
U.S. Brand NamesColestid®
Canadian Brand NamesColestid®
Pharmacologic CategoryAntilipemic Agent, Bile Acid Sequestrant
Use: Labeled IndicationsAdjunct in management of primary hypercholesterolemia; regression of arteriolosclerosis; relief of pruritus associated with elevated levels of bile acids; possibly used to decrease plasma half-life of digoxin in toxicity
Dosing: AdultsDyslipidemia: Oral:

Granules: 5-30 g/day given once or in divided doses 2-4 times/day; initial dose: 5 g 1-2 times/day; increase by 5 g at 1- to 2-month intervals

Tablets: 2-16 g/day; initial dose: 2 g 1-2 times/day; increase by 2 g at 1- to 2-month intervals

Dosing: ElderlyRefer to adult dosing.
Administration: OralDry powder should be added to at least 90 mL of liquid and stirred until completely mixed. Other drugs should be administered at least 1 hour before or 4 hours after colestipol.
Dietary ConsiderationsGranules, orange flavor, contain phenylalanine 18.2 mg/7.5 g.
ContraindicationsHypersensitivity to bile acid sequestering resins or any component of the formulation; bowel obstruction
Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Chronic use may be associated with bleeding problems.

- Constipation: May produce or exacerbate constipation problems; fecal impaction may occur. Hemorrhoids may be worsened.

Concurrent drug therapy issues:

- Decreased absorption (orally administered drugs): Not to be taken simultaneously with many other medicines (decreased absorption).

- Fat-soluble vitamins/folic acid: May interfere with fat-soluble vitamins (A, D, E, K) and folic acid.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

Geriatric ConsiderationsThe definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Elderly with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.
Pregnancy Risk FactorC
LactationNot recommended
Adverse Reactions

>10%: Gastrointestinal: Constipation

1% to 10%:

Central nervous system: Headache, dizziness, anxiety, vertigo, drowsiness, fatigue

Gastrointestinal: Abdominal pain and distention, belching, flatulence, nausea, vomiting, diarrhea

<1% (Limited to important or life-threatening): Peptic ulceration, gallstones, GI irritation and bleeding, anorexia, steatorrhea or malabsorption syndrome, cholelithiasis, cholecystitis, dyspnea

Drug Interactions

Amiodarone: Bile Acid Sequestrants may decrease the bioavailability of Amiodarone. *Risk D: Consider therapy modification*

Antidiabetic Agents (Thiazolidinedione): Bile Acid Sequestrants may decrease the absorption of Antidiabetic Agents (Thiazolidinedione). *Risk*

D: Consider therapy modification

Calcitriol: Bile Acid Sequestrants may decrease the serum concentration of Calcitriol. *Risk C: Monitor therapy*

Cardiac Glycosides: Bile Acid Sequestrants may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

Corticosteroids (Oral): Bile Acid Sequestrants may decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Diltiazem: Colestipol may decrease the absorption of Diltiazem. *Risk C: Monitor therapy*

Ezetimibe: Bile Acid Sequestrants may decrease the absorption of Ezetimibe. *Risk C: Monitor therapy*

Fibric Acid Derivatives: Bile Acid Sequestrants may decrease the absorption of Fibric Acid Derivatives. *Risk D: Consider therapy modification*

Loop Diuretics: Bile Acid Sequestrants may decrease the absorption of Loop Diuretics. *Risk D: Consider therapy modification*

Methotrexate: Bile Acid Sequestrants may decrease the absorption of Methotrexate. *Risk C: Monitor therapy*

Methylfolate: Colestipol may decrease the serum concentration of Methylfolate. *Risk C: Monitor therapy*

Niacin: Bile Acid Sequestrants may decrease the absorption of Niacin. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: Bile Acid Sequestrants may decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Raloxifene: Bile Acid Sequestrants may decrease the absorption of Raloxifene. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Bile Acid Sequestrants may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Thiazide Diuretics: Bile Acid Sequestrants may decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Thyroid Products: Bile Acid Sequestrants may decrease the absorption of Thyroid Products. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Bile Acid Sequestrants may decrease the absorption of Vitamin K Antagonists. *Risk C: Monitor therapy*

Test InteractionsIncreased prothrombin time; decreased cholesterol (S)

Nursing: Physical Assessment/MonitoringAssess other medications the patient may be taking for effectiveness and interactions. Monitor knowledge/teach patient appropriate preparation and use, possible adverse reactions, and symptoms to report. Monitor bowel function. Be alert to potential of constipation or hemorrhoid problems.

Patient EducationTake granules with 3-4 oz of water or fruit juice. Rinse glass with small amount of water to ensure full dose is taken. Take tablets one at a time. Other medications should be taken 1 hour before or 4 hours after colestipol. You may experience constipation (increased exercise, fluids, fruit, fiber, or stool softener may help); or drowsiness or dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report acute gastric pain, tarry stools, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Granules for suspension, as hydrochloride, oral: 5 g/packet (30s, 90s); 5 g/scoopful (500 g)

Colestid®: 5 g/packet (30s, 90s); 5 g/teaspoon (300 g, 500 g) [unflavored]

Colestid®, flavored: 5 g/packet (60s) [contains phenylalanine (18.2 mg/packet); orange flavor]

Colestid®, flavored: 5 g/scoopful (450 g) [contains phenylalanine (18.2 mg/scoopful); orange flavor]

Tablet, as hydrochloride: 1 g

Tablet, as hydrochloride, oral [micronized]:

Colestid®: 1 g

Generic AvailableYes

ManufacturerPharmacia & Upjohn

Pricing: U.S. (www.drugstore.com)

Granules (Colestid)

5 g (300): $84.60

5 g (500): $137.75

Granules (Colestid Flavored)

5 g (450): $112.19

Pack (Colestid)

5 g (30): $70.94

5 g (90): $199.11

Pack (Colestid Flavored)

5 g/7.5 g (60): $157.37

Tablets (Colestid)

1 g (120): $90.98

Tablets (Colestipol HCl)

1 g (120): $74.99

Mechanism of ActionBinds with bile acids to form an insoluble complex that is eliminated in feces; it thereby increases the fecal loss of bile acid-bound low density lipoprotein cholesterol

Pharmacodynamics/Kinetics

Absorption: None

Excretion: Feces

Related Information

- Lipid-Lowering Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or anxiety

Mental Health: Effects on Psychiatric TreatmentConstipation is common; may be exacerbated by concurrent psychotropic use; may decrease the absorption of TCAs

Cardiovascular ConsiderationsColestipol alone or when combined with an HMG-CoA reductase inhibitor is effective in lowering cholesterol. Colestipol may increase triglycerides, therefore, it should be avoided in patients with triglyceride levels ≥200 mg/dL. Potential factors that may limit patient compliance include GI side effects and the need to separate administration of other medications from colestipol.

Anesthesia and Critical Care Concerns/Other ConsiderationsColestipol alone or when combined with an HMG-CoA reductase inhibitor is effective in lowering cholesterol. Colestipol may increase triglycerides, therefore, it should be avoided in patients with triglyceride levels ≥200 mg/dL.

Index TermsColestipol Hydrochloride

Pronunciation(koe lis ti METH ate)

U.S. Brand NamesColy-Mycin® M

Canadian Brand NamesColy-Mycin® M

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled IndicationsTreatment of infections due to sensitive strains of certain gram-negative bacilli which are resistant to other antibacterials or in patients allergic to other antibacterials

Use: Unlabeled/InvestigationalUsed as nebulized inhalation in the prevention of *Pseudomonas aeruginosa* respiratory tract infections in immunocompromised patients, and used as nebulized inhalation adjunct agent for the treatment of *P. aeruginosa* infections in patients with cystic fibrosis and other seriously ill or chronically ill patients

Dosing: Adults**Note:** Doses should be based on ideal body weight in obese patients; dosage expressed in terms of colistin.

Susceptible infections:

I.M., I.V.: 2.5-5 mg/kg/day in 2-4 divided doses

Inhalation (unlabeled use): 50-75 mg in NS (3-4 mL total) via nebulizer 2-3 times/day

Cystic fibrosis (unlabeled dose): I.V.: 3-8 mg/kg/day in 3 divided doses **or** 60-70 mg every 8 hours, if tolerated, may increase to 80-100 mg every 8 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Doses should be based on ideal body weight in obese patients; dosage expressed in terms of colistin.

Susceptible infections:

I.M., I.V.: 2.5-5 mg/kg/day in 2-4 divided doses

Inhalation (unlabeled use): 50-75 mg in NS (3-4 mL total) via nebulizer 2-3 times/day

Cystic fibrosis (unlabeled dose): I.V.: 3-8 mg/kg/day in 3 divided doses (maximum dose: 70 mg)

Dosing: Renal Impairment

S_{cr} 1.3-1.5 mg/dL: 75-115 mg twice daily (approximately 2.5-3.8 mg/kg/day)

S_{cr} 1.6-2.5 mg/dL: 66-150 mg once or twice daily (approximately 2.5 mg/kg/day)

S_{cr} 2.6-4 mg/dL: 100-150 mg every 36 hours (approximately 1.5 mg/kg/day)

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH or CVVHD/CVVHDF: 2.5 mg/kg every 48 hours

Note: A single case report has demonstrated that the use of 2.5 mg/kg every 48 hours with a dialysate flow rate of 1 L/hour may be inadequate and that dosing every 24 hours was well-tolerated. Based on pharmacokinetic analysis, the authors recommend dosing as frequent as every 12 hours in patients receiving CRRT (Li, 2005).

Administration: I.V.Parenteral: Reconstitute vial with 2 mL SWFI resulting in a concentration of 75 mg colistin/mL; swirl gently to avoid frothing. Administer by I.M., direct I.V. injection over 3-10 minutes, intermittent infusion over 30 minutes, or by continuous I.V. infusion. For continuous I.V. infusion, one-half of the total daily dose is administered by direct I.V. injection over 3-10 minutes followed 1-2 hours later by the remaining one-half of the total daily dose diluted in a compatible I.V. solution infused over 22-23 hours. The final concentration for administration should be based on the patient's fluid needs.

Administration: InhalationUnlabeled: Further dilute dose to a total volume of 3-4 mL in NS and administer via nebulizer. If patient is on a ventilator, place medicine in a T-piece at the midinspiratory circuit of the ventilator. Administer solution promptly following preparation to decrease possibility of high concentrations of colistin from forming which may lead to potentially life-threatening lung toxicity.

StorageStore intact vials (prior to reconstitution) at 20°C to 25°C (68°F to 77°F); reconstituted vials may be refrigerated at 2°C to 8°C (36°F to 46°F) or stored at 20°C to 25°C (68°F to 77°F) for up to 24 hours. Solutions for infusion should be freshly prepared; do not use beyond 24 hours.

ReconstitutionFor I.V. use, reconstitute each vial with 2 mL of SWFI; swirl gently to avoid foaming. May further dilute in D_5W or NS for I.V. infusion. For nebulized inhalation (unlabeled use), reconstitute with NS; should be used promptly after preparation; do not use after 24 hours.

CompatibilityStable in $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, LR, NS.

Compatibility in syringe: Compatible: Ampicillin, penicillin G sodium.

Compatibility when admixed: Compatible: Amikacin, ascorbic acid injection, chloramphenicol, cimetidine, diphenhydramine, heparin, lincomycin, penicillin G potassium, penicillin G sodium, phenobarbital, polymyxin B sulfate, ranitidine, vitamin B complex with C. **Incompatible:** Cefazolin, erythromycin lactobionate, hydrocortisone sodium succinate, kanamycin.

ContraindicationsHypersensitivity to colistimethate, colistin, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Transient, reversible neurological disturbances (eg, dizziness, numbness, paresthesia, tingling, vertigo) may occur.

- Renal toxicity: Dose-dependent nephrotoxicity has been reported, generally reversible upon discontinuation of treatment.

- Respiratory arrest: Respiratory arrest has been reported with use; impaired renal function may increase the risk for neuromuscular blockade and apnea.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with pre-existing renal disease; dosage adjustments may be required. Impaired renal function may increase the risk for respiratory arrest.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in animal reproduction studies; therefore, the manufacturer classifies colistimethate as pregnancy category C. Colistimethate crosses the placenta in humans. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if colistimethate sodium is excreted in human milk, but colistin sulphate (another form of colistin) is excreted in human milk. The manufacturer recommends caution if giving colistimethate sodium to a breast-feeding woman. If colistimethate sodium reaches the breast milk, nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Colistimethate in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, fever, headache, slurred speech, vertigo

Dermatologic: Pruritus, rash, urticaria

Gastrintestinal: GI upset

Neuromuscular & skeletal: Paresthesia (extremities, oral); weakness (lower limb)

Renal: BUN increased, creatinine increased, nephrotoxicity, proteinuria, urine output decreased

Respiratory: Apnea, respiratory arrest

Postmarketing, and/or case reports: Lung toxicity (bronchoconstriction, bronchospasm, chest tightness, respiratory distress, acute respiratory failure following inhalation)

Drug Interactions

Aminoglycosides: May enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Amphotericin B: May enhance the nephrotoxic effect of Colistimethate. *Risk D: Consider therapy modification*

Capreomycin: May enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Colistimethate may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Polymyxin B: May enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Colistimethate. *Risk D: Consider therapy modification*

Monitoring ParametersSerum creatinine, BUN; urine output; signs of neurotoxicity

Monitoring: Lab TestsSerum creatinine, BUN, urine output

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as colistin base: 150 mg

Coly-Mycin® M: 150 mg

Generic AvailableYes

Mechanism of ActionHydrolyzed to colistin, which acts as a cationic detergent which damages the bacterial cytoplasmic membrane causing leaking of intracellular substances and cell death

Pharmacodynamics/Kinetics

Distribution: Widely, except for CNS, synovial, pleural, and pericardial fluids

Metabolism: Colistimethate is hydrolyzed to colistin

Half-life elimination: I.M., I.V.: 2-3 hours; Anuria: ≤2-3 days

Time to peak: I.V.: 10 minutes

Excretion: Primarily urine (as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other Considerations

Colistimethate: Possible Association of Death Occurring After Off-Label Use of Nebulized Solution - June, 2007

The Food and Drug Administration (FDA) has issued a public health advisory and is notifying clinicians of an investigation surrounding the death of a cystic fibrosis (CF) patient which may be connected to the use of premixed (pharmacy compounded), colistimethate vials for inhalation via a nebulizer.

The FDA is reminding healthcare providers of the proposed mechanism that may have contributed to the death. Colistimethate, an inactive prodrug, is converted to the bioactive colistin by spontaneous hydrolysis once colistimethate is mixed into aqueous solution. Colistin is comprised of 2 components, colistin A (polymyxin E1) and colistin B (polymyxin E2). Polymyxin E1 has been shown to cause localized airway inflammation in animal studies and may result in lung toxicity in humans. Clinicians who continue to prescribe colistimethate for inhalation should be aware of this potentially life-threatening effect and should administer solutions for inhalation promptly following preparation of solution.

On June 12, 2007, the Cystic Fibrosis Foundation issued an alert recommending that patients not use colistimethate for inhalation premixed by pharmacies; patients should prepare their colistimethate nebulizer inhalation solutions immediately prior to use.

Collagen (Absorbable/Dental)

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(KOL la jen, ab SORB able / DEN tl)
U.S. Brand NamesCollaCote®; CollaPlug®; CollaTape®
Pharmacologic CategoryHemostatic Agent
Use: Labeled IndicationsHemostatic
Use: DentalControl of bleeding created during dental surgery
Dosing: AdultsControl of bleeding: Topical: A sufficiently large dressing should be selected so as to completely cover the oral wound
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
ContraindicationsNo data reported
Warnings/Precautions

Other warnings/precautions:

- Appropriate use: Should not be used on infected or contaminated wounds.

LactationCompatible
Adverse ReactionsNo data reported.
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Wound dressing:

$^{3}/_{8}$” x $^{3}/_{4}$”

$^{3}/_{4}$” x 1 $^{1}/_{2}$”

1” x 3”

Generic AvailableYes
Mechanism of ActionThe highly porous sponge structure absorbs blood and wound exudate. The collagen component causes aggregation of platelets which bind to collagen fibrils. The aggregated platelets degranulate, releasing coagulation factors that promote the formation of fibrin.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Collagen Hemostat

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Avitene® may be confused with Ativan®

Over 100 reports of paralysis or other neural deficits have been received by the FDA, attributable to collagen hemostat-associated neuronal impingement; see Warnings/Precautions

Pronunciation(KOL la jen HEE moe stat)
U.S. Brand NamesAvitene®; Avitene® Flour; Avitene® Ultrafoam; Avitene® UltraWrap™; EndoAvitene®; Helistat®; Helitene®; Instat™; Instat™ MCH; SyringeAvitene™
Pharmacologic CategoryHemostatic Agent
Use: Labeled IndicationsAdjunct to hemostasis when control of bleeding by ligature is ineffective or impractical
Use: DentalAdjunct to hemostasis when control of bleeding by ligature is ineffective or impractical
Dosing: AdultsHemostasis: Topical: Apply dry directly to source of bleeding; remove excess material after ~10-15 minutes
Dosing: ElderlyRefer to adult dosing.
StorageStore at controlled room temperature. Inactivated by autoclaving; do not resterilize. Do not use if package is damaged. Do not reuse after opening.
ContraindicationsHypersensitivity to any component of the formulation; products of bovine origin; closure of skin incisions, contaminated wounds; application to bone surfaces to which prosthetic materials are attached with methylmethacrylate adhesives
Warnings/Precautions

Concerns related to adverse effects:

- Pain/numbness/paralysis: Pain, numbness, or paralysis have been reported if used near a bony or neural space and left inside patient; use minimum amount necessary to achieve hemostasis.

Other warnings/precautions:

- Appropriate use: Remove as much of agent as possible after hemostasis is achieved. Do not leave in a contaminated or infected space. Fragments of MCH may pass through filters of blood scavenging systems; avoid reintroduction of blood from operative sites treated with MCH. Not intended to treat systemic coagulation disorders. Not for use when origin of bleeding is unknown.

Adverse ReactionsFrequency not defined.

Miscellaneous: Adhesion formation, allergic reaction, edema, foreign body reaction, hematoma, inflammation, potentiation of infection

Postmarketing and/or case reports: Numbness, pain, paralysis, subgaleal seroma; alveolalgia and transient laryngospasm with dental use

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Pad (Instat™) [bovine derived]: 1 inch x 2 inch (24s); 3 inch x 4 inch (24s)

Powder:

Avitene® Flour [microfibrillar product, bovine derived]: 0.5 g, 1 g, 5 g

Helitene® [bovine derived]: 0.5 g, 1 g

Instat™ MCH [microfibrillar product, bovine derived]: 0.5 g, 1 g

SyringeAvitene™ [microfibrillar product, bovine derived, prefilled syringe]: 1 g

Sheet:

Avitene® [microfibrillar product, bovine derived, nonwoven web]: 35 mm x 35 mm (1s); 70 mm x 35 mm (6s, 12s); 70 mm x 70 mm (6s, 12s)

EndoAvitene® [microfibrillar product, bovine derived, preloaded applicator]: 5 mm diameter (6s); 10 mm diameter (6s)

Sponge:

Avitene® Ultrafoam [microfibrillar product, bovine derived]: 2 cm x 6.25 cm x 7 mm (12s); 8 cm x 6.25 cm x 1 cm (6s); 8 cm x 12.5 cm x 1 cm (6s); 8 cm x 12.5 cm x 3 mm (6s)

Avitene® UltraWrap™ [microfibrillar product, bovine derived]: 8 cm x 12.5 cm (6s)

Helistat® [bovine derived]: 0.5 inch x 1 inch x 7 mm (18s) [packaged as 3 strips of 6 sponges]; 3 inch x 4 inch x 5 inch (10s)

Generic Available No

Mechanism of Action Collagen hemostat is an absorbable topical hemostatic agent prepared from purified bovine corium collagen and shredded into fibrils. Physically, microfibrillar collagen hemostat yields a large surface area. Chemically, it is collagen with hydrochloric acid noncovalently bound to some of the available amino groups in the collagen molecules. When in contact with a bleeding surface, collagen hemostat attracts platelets which adhere to its fibrils and undergo the release phenomenon. This triggers aggregation of the platelets into thrombi in the interstices of the fibrous mass, initiating the formation of a physiologic platelet plug.

Pharmacodynamics/Kinetics

Onset: Hemostasis: 2-5 minutes

Absorption: ≥8 weeks

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Collagenase

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(KOL la je nase)
U.S. Brand NamesSantyl®
Pharmacologic CategoryEnzyme, Topical Debridement
Use: Labeled IndicationsPromotes debridement of necrotic tissue in dermal ulcers and severe burns

Orphan drug: Injection: Treatment of Peyronie's disease; treatment of Dupytren's disease

Dosing: AdultsDermal ulcers, burns: Topical: Apply once daily.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: TopicalFor external use only. Clean target area of all interfering agents listed above. If infection is persistent, apply powdered antibiotic first. Do not introduce into major body cavities. Monitor debilitated patients for systemic bacterial infections.
ContraindicationsHypersensitivity to collagenase or any component of the formulation
Warnings/Precautions

Special populations:

- Debilitated patients: Monitor debilitated patients for systemic bacterial infections because debriding enzymes may increase the risk of bacteremia.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Administration: For external use only; avoid contact with eyes.

Geriatric ConsiderationsPreventive skin care should be instituted in all older patients at high risk for pressure ulcers. Collagenase is indicated in stage 3 and 4 pressure ulcers.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not defined.

Local: Irritation, pain and burning may occur at site of application

Postmarketing and/or case reports: Hypersensitivity reaction

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringFor external use only. Clean target area of all interfering agents (eg, detergents, benzalkonium chloride, hexachlorophene, nitrofurazone, tincture of iodine, and heavy metal ions silver and mercury). If infection is persistent, apply powdered antibiotic first. Do not introduce into major body cavities. Monitor debilitated patients for systemic bacterial infections. When applied to large areas or for extensive periods of time, monitor for adverse reactions. Teach patient (or caregiver) appropriate application (if self administered) and adverse symptoms to report.
Patient EducationUse exactly as directed; do not overuse. Clean target area of all interfering agents (eg, detergents, benzalkonium chloride, hexachlorophene, nitrofurazone, tincture of iodine, and heavy metal ions silver and mercury). Wear gloves to apply a thin film to affected area. If dressing is necessary, use a porous dressing. Avoid contact with eyes. Report increased swelling, redness, rash, itching, signs of infection, worsening of condition, or lack of healing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ointment:

Santyl®: 250 units/g (15 g, 30 g)

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Ointment (Santyl)

250 units/g (15): $55.99

Mechanism of ActionCollagenase is an enzyme derived from the fermentation of *Clostridium histolyticum* and differs from other proteolytic enzymes in that its enzymatic action has a high specificity for native and denatured collagen. Collagenase will not attack collagen in healthy tissue or newly formed granulation tissue. In addition, it does not act on fat, fibrin, keratin, or muscle.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Conivaptan

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(koe NYE vap tan)

U.S. Brand NamesVaprisol®

Pharmacologic CategoryVasopressin Antagonist

Use: Labeled IndicationsTreatment of euvolemic and hypervolemic hyponatremia in hospitalized patients

Dosing: AdultsEuvolemic hyponatremia: I.V.:

Loading dose: 20 mg infused over 30 minutes, followed by continuous infusion of 20 mg over 24 hours

Maintenance: 20 mg/day as continuous infusion over 24 hours; may titrate to maximum of 40 mg/day if serum sodium not rising sufficiently; total duration of therapy not to exceed 4 days

Dosing: ElderlyRefer to adult dosing.

Administration: I.V.For intravenous use only; do not administer undiluted; infuse into large veins and change infusion site every 24 hours to minimize vascular irritation

Administration: I.V. DetailpH: 3

StorageStore ampuls in original cardboard container at 15°C to 30°C (59°F to 86°F); protect from light. After dilution, infusion bag (final concentration of 0.08-0.2 mg/mL) is stable at room temperature for 24 hours.

ReconstitutionDilute loading dose of 20 mg in 100 mL D_5W and continuous infusion dose of 20-40 mg in 250 mL D_5W.

CompatibilityStable in D_5W; **incompatible** with LR, NS.

ContraindicationsHypersensitivity to conivaptan or any component of the formulation; use in hypovolemic hyponatremia; concurrent use with strong CYP3A4 inhibitors (eg, ketoconazole, itraconazole, ritonavir, indinavir, and clarithromycin)

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension: Discontinue if hypotension occur; may correct and reinitiate if necessary.
- Hypovolemia: Discontinue if hypovolemia occurs; may correct and reinitiate if necessary.
- Injection-site reactions: May cause injection-site reactions.

Disease-related concerns:

- Heart failure: Safety and efficacy have not been established in heart failure patients. Use in 79 hypervolemic, hyponatremic heart failure patients led to increased adverse events, atrial arrhythmias, and sepsis when compared to 10 similar heart failure patients treated with placebo. In other heart failure studies, conivaptan did not show significant improvements in outcomes over placebo.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- High potential for interactions: Use contraindicated in patients taking strong CYP3A4 inhibitors; use caution in patients taking moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions). Consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Monitor closely for rate of serum sodium increase and neurological status; rapid serum sodium correction (>12 mEq/L/24 hours) can lead to permanent neurological damage. Discontinue use if rate of serum sodium increase is undesirable; may reinitiate infusion (at reduced dose) if hyponatremia persists in the absence of neurological symptoms typically associated with rapid sodium rise.

Geriatric ConsiderationsAdverse events in elderly patients were generally similar to those seen in younger patients. In clinical studies, 52% of patients were >65 years of age and 34% were >75 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies indicate that conivaptan accumulates in the placenta (2.2-fold relative to maternal plasma); systemic exposure to fetus is likely. No teratogenic effects have been observed in animal studies; however, these studies have shown decreased neonatal viability and delayed growth and development at doses lower than those required for therapeutic efficacy. There are no adequate and well-controlled studies in pregnant women. Use only if benefit outweighs risk.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

- Cardiovascular: Orthostatic hypotension (6% to 14%)
- Central nervous system: Fever (5% to 11%)
- Endocrine & metabolic: Hypokalemia (10% to 22%)
- Local: Injection site reactions including pain, erythema, phlebitis, swelling (63% to 73%)

1% to 10%:

- Cardiovascular: Hypertension (6% to 8%), hypotension (5% to 8%), edema (3% to 8%), phlebitis (5%), atrial fibrillation (2% to 5%), ECG abnormality (up to 5%)
- Central nervous system: Headache (8% to 10%), insomnia (4% to 5%), confusion (up to 5%), pain (2%)
- Dermatologic: Pruritus (1% to 5%), erythema (3%)
- Endocrine & metabolic: Hyponatremia (3% to 8%), hypomagnesemia (2% to 5%), hyper-/hypoglycemia (3%)
- Gastrointestinal: Constipation (6% to 8%), vomiting (5% to 7%), diarrhea (up to 7%), nausea (5%), dry mouth (4%), dehydration (2%), oral candidiasis (2%)
- Genitourinary: Urinary tract infection (4% to 5%)
- Hematologic: Anemia (4%)
- Renal: Polyuria (5% to 6%), hematuria (2%)
- Respiratory: Pneumonia (2% to 5%)
- Miscellaneous: Thirst (3% to 6%)
- <1%, postmarketing, and/or case reports (limited to important or life-threatening): Atrial arrhythmias, sepsis

Metabolism/Transport Effects **Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (strong)

Drug Interactions

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Conivaptan. *Risk X: Avoid combination*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Digoxin: Conivaptan may increase the serum concentration of Digoxin. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease the levels/effects of conivaptan.

Monitoring ParametersRate of serum sodium increase, blood pressure, volume status, urine output

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (this is a strong inhibitor of CYP3A4; interactions may increase or decrease levels/effects drugs and increase potential for severe toxicity or loss of effectiveness). Assess results of laboratory tests (serum sodium levels [overly-rapid rise in serum sodium concentration may result in serious sequelae]), therapeutic effectiveness, and adverse response (eg, fluid status, blood pressure, neurological status) at beginning of therapy and at regular intervals during therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsRate of serum sodium increase

Patient EducationDo not take any new medication during therapy without consulting prescriber. This drug can only be given by infusion; report immediately any pain, burning, or swelling at infusion site; sudden chest pain; difficulty breathing or swallowing; or chills. May cause headache (consult prescriber for appropriate analgesic); excessive thirst (maintain recommended fluid intake; sucking lozenges may reduce thirst). Report immediately unusual lethargy or restlessness, spastic limb movements, or seizures. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Vaprisol®: 5 mg/mL (4 mL) [single-use ampul; contains propylene glycol and ethanol]

Generic AvailableNo

ManufacturerAstellas Tokai Co, Ltd

Mechanism of ActionConivaptan is an arginine vasopressin (AVP) receptor antagonist with affinity for AVP receptor subtypes V_{1A} and V_2. The antidiuretic action of AVP is mediated through activation of the V_2 receptor, which functions to regulate water and electrolyte balance at the level of the collecting ducts in the kidney. Serum levels of AVP are commonly elevated in euvolemic or hypervolemic hyponatremia, which results in the dilution of serum sodium and the relative hyponatremic state. Antagonism of the V_2 receptor by conivaptan promotes the excretion of free water (without loss of serum electrolytes) resulting in net fluid loss, increased urine output, decreased urine osmolality, and subsequent restoration of normal serum sodium levels.

Pharmacodynamics/Kinetics

Protein binding: 99%

Metabolism: Hepatic via CYP3A4 to four minimally-active metabolites

Half-life elimination: 6.7-8.6 hours

Excretion: Feces (83%); urine (12%, primarily as metabolites)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dry mouth, oral candidiasis, orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHeadache is common; may cause insomnia or confusion

Mental Health: Effects on Psychiatric TreatmentAdverse effects associated with this agent may mimic those of psychotropic agents (eg, headache with SSRIs or polyuria with lithium). Consider this when evaluating patients' side effect burden. Carbamazepine, phenytoin, and phenobarbital may decrease the effects of conivaptan. Conversely, nefazodone may increase conivaptan levels. Conivaptan may increase levels of benzodiazepines (midazolam and triazolam are contraindicated), mirtazapine, nefazodone, sildenafil, and venlafaxine.

Index TermsConivaptan Hydrochloride; YM087

Corticorelin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Acthrel® may be confused with Acthar®

Corticorelin may be confused with corticotropin

Pronunciation(kor ti koe REL in)

U.S. Brand NamesActhrel®

Pharmacologic CategoryDiagnostic Agent

Use: Labeled IndicationsDiagnostic test used in adrenocorticotropic hormone (ACTH)-dependent Cushing's syndrome to differentiate between pituitary and ectopic production of ACTH

Dosing: AdultsTesting pituitary corticotrophin function: I.V.: 1 mcg/kg; dosages >100 mcg have been associated with an increase in adverse effects

Note: Venous blood samples should be drawn 15 minutes before and immediately prior to corticorelin administration to determine baseline ACTH and cortisol. At 15-, 30-, and 60 minutes after administration, venous blood samples should be drawn again to determine response. **Basal and peak responses differ depending on AM or PM administration; therefore, any repeat evaluations are recommended to be done at the same time of day as initial testing.**

Administration: I.V.Administer I.V. over 30-60 seconds

Administration: I.V. DetailUse of heparin to maintain patency is not recommended.

ContraindicationsHypersensitivity to corticorelin or any component of the formulation

Warnings/Precautions

Concurrent drug therapy issues:

- Heparin: Use of heparin to maintain I.V. patency is not recommended; may increase risk of hypotension.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children (limited data).

Dosage form specific issues:

- Sheep derived: Use with caution in patients with previous reactions to sheep products (lanolin).

Other warnings/precautions:

- Bolus doses: Doses administered as a bolus or in excess of recommendations have been associated with hypotension, transient tachycardia, dyspnea, chest tightness, loss of consciousness. and asystole. Infusion over 30 seconds may reduce the potential for these effects.

- False negative responses: May occur in 5% to 10% of patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Cardiovascular: Flushing (face, neck and upper chest, 16%)

1% to 10%:

Gastrointestinal: Metallic taste (transient, 5%)

Respiratory: Dyspnea (urge to inspire, 6%)

<1% (Limited to important or life-threatening): Hypotension (severe), seizure

Drug Interactions

Corticosteroids: May diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Heparin: May enhance the adverse/toxic effect of Corticorelin. Significant hypotension and bradycardia have been previously attributed to this combination. *Risk X: Avoid combination*

Reference Range

High basal plasma ACTH and cortisol (20-40 mcg/dL) resulting in **increased** plasma ACTH and cortisol after administration of test indicates **ACTH-dependent disease of pituitary origin.**

High basal plasma ACTH (may be very high) and cortisol (20-40 mcg/dL) resulting in **little to no change** in plasma ACTH and cortisol after administration of test indicates **ACTH-dependent syndrome of ectopic origin.**

Nursing: Physical Assessment/MonitoringMonitor patient closely when administering medication. Can cause hypotension, transient tachycardia, dyspnea, chest tightness, loss of consciousness, and asystole.

Patient EducationMay cause flushing or metallic taste sensation. Report difficulty breathing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as trifluoroacetate:

Acthrel®: 100 mcg [ovine derived; contains lactose 10 mg]

Generic AvailableNo

ManufacturerFerring Pharmaceuticals

Mechanism of ActionStimulates adrenocorticotropic hormone (ACTH) release from anterior pituitary. ACTH stimulates the adrenal cortex to produce cortisol.

Pharmacodynamics/Kinetics

Onset: I.V.: Plasma ACTH level increases 2 minutes after injection; plasma cortisol level increases within 10 minutes after injection

Duration: I.V.: Plasma ACTH and cortisol levels remain elevated for up to 2 hours

Time to peak, plasma: ACTH: 15-60 minutes; cortisol: 30-120 minutes; both levels show a dose-dependent, biphasic response with a second lower peak 2-3 hours after injection

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCorticorelin Ovine Triflutate; Human Corticotrophin-Releasing Hormone, Analogue; Ovine Corticotrophin-Releasing Hormone

Corticotropin

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Corticotropin may be confused with corticorelin

Pronunciation(kor ti koe TROE pin)
U.S. Brand NamesH.P. Acthar® Gel
Pharmacologic CategoryCorticosteroid, Systemic
Use: Labeled IndicationsAcute exacerbations of multiple sclerosis; diagnostic aid in adrenocortical insufficiency, severe muscle weakness in myasthenia gravis

Cosyntropin is preferred over corticotropin for diagnostic test of adrenocortical insufficiency (cosyntropin is less allergenic and test is shorter in duration)

Dosing: Adults

Acute exacerbation of multiple sclerosis: I.M.: 80-120 units/day for 2-3 weeks

Repository injection: I.M., SubQ: 40-80 units every 24-72 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Anti-inflammatory/immunosuppressant: I.M.: 0.8 units/kg/day or 25 units/m^2/day divided every 12-24 hours

Infantile spasms: Various regimens have been used. Some neurologists recommend low-dose ACTH (5-40 units/day) for short periods (1-6 weeks), while others recommend larger doses of ACTH (40-160 units/day) for long periods of treatment (3-12 months). Well designed comparative dosing studies are needed. Example of low dose regimen:

Initial: I.M.: 20 units/day for 2 weeks, if patient responds, taper and discontinue; if patient does not respond, increase dose to 30 units/day for 4 weeks then taper and discontinue

Usual dosage range: I.M.: 20-40 units/day or 5-8 units/kg/day in 1-2 divided doses; range: 5-160 units/day

Note: Oral prednisone (2 mg/kg/day) was as effective as I.M. ACTH gel (20 units/day) in controlling infantile spasms

Dietary ConsiderationsMay increase renal loss of potassium, calcium, zinc, and vitamin C; may need to increase dietary intake or give supplements.
StorageStore in the refrigerator. Warm gel before administration.
ContraindicationsHypersensitivity to corticotropin or any component of the formulation; scleroderma; osteoporosis; systemic fungal infections; ocular herpes simplex; peptic ulcer
Pregnancy Risk FactorC
Pregnancy ConsiderationsEmbryocidal effects may be observed following corticotropin use during pregnancy. Endogenous ACTH levels are increased during pregnancy. Some studies have shown an association between first trimester systemic corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsCorticosteroids are excreted in human milk; information specific to corticotropin has not been located.
Adverse ReactionsFrequency not defined.

Central nervous system: Insomnia, nervousness

Dermatologic: Hirsutism

Endocrine & metabolic: Diabetes mellitus

Gastrointestinal: Increased appetite, indigestion

Neuromuscular & skeletal: Arthralgia

Ocular: Cataracts

Respiratory: Epistaxis

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, gelatin: 80 units/mL (5 mL)

Generic AvailableNo

Mechanism of ActionStimulates the adrenal cortex to secrete adrenal steroids (including hydrocortisone, cortisone), androgenic substances, and a small amount of aldosterone

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia and nervousness are common; may cause euphoria or hallucinations

Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the levels of corticotropin

Index TermsACTH; Adrenocorticotropic Hormone; Corticotropin, Repository

Medication Safety Issues

Sound-alike/look-alike issues:

Cortisone may be confused with Cortizone®

Pronunciation(KOR ti sone)

Pharmacologic CategoryCorticosteroid, Systemic

Use: Labeled IndicationsManagement of adrenocortical insufficiency

Dosing: AdultsIf possible, administer glucocorticoids before 9 AM to minimize adrenocortical suppression; dosing depends upon the condition being treated and the response of the patient. **Note:** Supplemental doses may be warranted during times of stress in the course of withdrawing therapy.

Anti-inflammatory or immunosuppressive: Oral: 25-300 mg/day in divided doses every 12-24 hours

Physiologic replacement: Oral: 25-35 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricIf possible, administer glucocorticoids before 9 AM to minimize adrenocortical suppression; dosing depends upon the condition being treated and the response of the patient. **Note:** Supplemental doses may be warranted during times of stress in the course of withdrawing therapy.

Anti-inflammatory or immunosuppressive: Oral: 2.5-10 mg/kg/day **or** 20-300 mg/m^2/day in divided doses every 6-8 hours

Physiologic replacement: Oral: 0.5-0.75 mg/kg/day **or** 20-25 mg/m^2/day in divided doses every 8 hours

Dosing: Renal Impairment

Hemodialysis: Supplemental dose is not necessary.

Peritoneal dialysis: Supplemental dose is not necessary.

Calculations

- Corticosteroid Conversion

Administration: OralInsoluble in water.

Dietary ConsiderationsMay need diet with increased potassium, pyridoxine, vitamin C, vitamin D, folate, calcium, and phosphorus and decreased sodium; may be taken with food to decrease GI distress.

ContraindicationsHypersensitivity to cortisone acetate or any component of the formulation; serious infections, except septic shock or tuberculous meningitis; administration of live virus vaccines

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria or viral hepatitis. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment).

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Myopathy: Acute myopathy has been reported with high dose corticosteroids, usually in patients with neuromuscular transmission disorders; may involve ocular and/or respiratory muscles; monitor creatine kinase; recovery may be delayed.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarction (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Elderly: Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible effective dose for the shortest duration.

- Pediatrics: May affect growth velocity; growth should be routinely monitored in pediatric patients.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw therapy with gradual tapering of dose.

Geriatric ConsiderationsBecause of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly, in the smallest possible dose, and for the shortest possible time.

Pregnancy ConsiderationsAdverse events have been observed with corticosteroids in animal reproduction studies. Cortisone is found in cord blood; endogenous maternal cortisol (active) is metabolized by placental enzymes to cortisone (inactive), regulating the amount of maternal glucocorticoids reaching the fetus. Some studies have shown an association between first trimester systemic corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy. Women exposed to cortisone during pregnancy for the treatment of an autoimmune disease may contact the OTIS Autoimmune Diseases Study at 877-311-8972.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Insomnia, nervousness

Gastrointestinal: Increased appetite, indigestion

1% to 10%:

Dermatologic: Hirsutism

Endocrine & metabolic: Diabetes mellitus

Neuromuscular & skeletal: Arthralgia

Ocular: Cataracts, glaucoma

Respiratory: Epistaxis

<1%: Abdominal distention, acne, alkalosis, amenorrhea, bruising, Cushing's syndrome, delirium, edema, euphoria, fractures, glucose intolerance, growth suppression, hallucinations, headache, hyperglycemia, hyperpigmentation, hypersensitivity reactions, hypertension, hypokalemia, mood swings, muscle wasting, myalgia, nausea, osteoporosis, pancreatitis, peptic ulcer, pituitary-adrenal axis suppression, pseudotumor cerebri, psychoses, seizure, skin atrophy, sodium and water retention, ulcerative esophagitis, vertigo, vomiting

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Somatropin: May diminish the therapeutic effect of Cortisone. Growth hormone may reduce the conversion of cortisone to the active cortisol metabolite. *Risk D: Consider therapy modification*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Limit caffeine intake.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as acetate: 25 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Cortisone Acetate)

25 mg (30): $17.99

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Oral: ~2 hours; I.M.: 20-48 hours

Duration: 30-36 hours

Absorption: Slow

Distribution: Muscles, liver, skin, intestines, and kidneys; crosses placenta; enters breast milk

Metabolism: Hepatic to inactive metabolites

Half-life elimination: 0.5-2 hours; End-stage renal disease: 3.5 hours

Excretion: Urine and feces

Related Information

- Corticosteroids

Dental Health: Effects on Dental TreatmentA compromised immune response may occur if patient has been taking systemic cortisone. The need for corticosteroid coverage in these patients should be considered before any dental treatment; consult with physician.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia and nervousness are common; may cause euphoria or hallucinations

Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the levels of cortisone

Index TermsCompound E; Cortisone Acetate

Medication Safety Issues

Sound-alike/look-alike issues:

Cortrosyn® may be confused with colchicine, Cotazym®

Pronunciation(koe sin TROE pin)
U.S. Brand NamesCortrosyn®
Canadian Brand NamesCortrosyn®
Pharmacologic CategoryDiagnostic Agent
Use: Labeled IndicationsDiagnostic test to differentiate primary adrenal from secondary (pituitary) adrenocortical insufficiency
Dosing: Adults

Diagnosis of adrenocortical insufficiency: I.M., I.V. (over 2 minutes): Peak plasma cortisol concentrations usually occur 45-60 minutes after cosyntropin administration

0.25-0.75 mg

Note: When greater cortisol stimulation is needed, an I.V. infusion may be used: 0.25 mg administered at 0.04 mg/hour over 6 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Diagnosis of adrenocortical insufficiency: I.M., I.V. (over 2 minutes): Peak plasma cortisol concentrations usually occur 45-60 minutes after cosyntropin administration.

Children <2 years: 0.125 mg

Children >2 years: 0.25 mg

Note: When greater cortisol stimulation is needed, an I.V. infusion may be used: Children >2 years: Refer to adult dosing.

Administration: I.V.Administer I.V. doses over 2 minutes
Storage

Powder for injection: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F).

I.V. infusion: Stable for 12 hours at room temperature; stable for 21 days under refrigeration.

Reconstitution

I.M.: Reconstitute cosyntropin 0.25 mg with NS 1 mL.

I.V. push: Reconstitute cosyntropin 0.25 mg with NS 2-5 mL.

I.V. infusion: Mix in NS or D_5W.

ContraindicationsHypersensitivity to cosyntropin or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Corticotropin allergy: Use with caution in patients with a history of allergic reactions to corticotropin or pre-existing allergic disease.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, hypertension, peripheral edema, tachycardia

Dermatologic: Rash

Local: Whealing with redness at the injection site

Miscellaneous: Anaphylaxis, hypersensitivity reaction

Drug InteractionsThere are no known significant interactions.
Test InteractionsDecreased effect: Spironolactone, hydrocortisone, cortisone, etomidate

Reference RangeNormal baseline cortisol; increase in serum cortisol after cosyntropin injection of >7 mcg/dL or peak response >18 mcg/dL; plasma cortisol concentrations should be measured immediately before and exactly 30 minutes after a dose

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 0.25 mg

Generic AvailableNo

ManufacturerOrganon Inc

Mechanism of ActionStimulates the adrenal cortex to secrete adrenal steroids (including hydrocortisone, cortisone), androgenic substances, and a small amount of aldosterone

Pharmacodynamics/KineticsTime to peak, serum: I.M., IVP: ~1 hour; plasma cortisol levels rise in healthy individuals within 5 minutes

Pharmacotherapy PearlsEach 0.25 mg of cosyntropin is equivalent to 25 units of corticotropin.

Patient should not receive corticosteroids or spironolactone the day prior and the day of the test.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the levels of cosyntropin

Anesthesia and Critical Care Concerns/Other Considerations

Septic Shock: A recent randomized, double-blind, placebo-controlled trial assessed whether low-dose corticosteroid administration could improve 28-day survival in patients with septic shock and relative adrenal insufficiency. Relative adrenal insufficiency was defined as an inappropriate response to corticotropin administration (increase of serum cortisol of ≤9 mcg/dL from baseline). Cortisol levels were drawn immediately before corticotropin administration and 30-60 minutes afterwards. Three hundred adult septic shock patients requiring mechanical ventilation and vasopressor support were randomized to either hydrocortisone (50 mg IVP every 6 hours) and fludrocortisone (50 mcg tablet daily via nasogastric tube) or matching placebos for 7 days. In patients who did not appropriately respond to corticotropin (nonresponders), there were significantly fewer deaths in the active treatment group. Vasopressor therapy was withdrawn more frequently in this subset of the active treatment group. Adverse events were similar in both groups. Patients who lack adrenal reserve and thus have relative adrenal insufficiency during the stress of septic shock may benefit from physiologic steroid replacement. However, there was a trend for increased mortality in patients who responded to the corticotropin test (increase serum cortisol >9 mcg/dL from baseline). These patients may not benefit from physiologic steroid replacement. Further study is required to better characterize the patient populations who may benefit.

The 2008 Surviving Sepsis Campaign guidelines recommend doses of corticosteroids comparable to >300 mg hydrocortisone daily **not** be used in severe sepsis or septic shock for the purpose of treating septic shock (Grade 1A). They also recommend corticosteroids **not** be administered for the treatment of sepsis in the absence of shock. There is, however, no contraindication to continuing maintenance steroid therapy or to using stress dose steroids if the patient's endocrine or corticosteroid administration history warrants (Grade 1D).

Index TermsSynacthen; Tetracosactide

Medication Safety Issues

Sound-alike/look-alike issues:

Intal® may be confused with Endal®

NasalCrom® may be confused with Nasacort®, Nasalide®

Pronunciation(KROE moe lin)

U.S. Brand NamesCrolom®; Gastrocrom®; Intal®; NasalCrom® [OTC]

Canadian Brand NamesApo-Cromolyn®; Intal®; Nalcrom®; Nu-Cromolyn; Opticrom®

Pharmacologic CategoryMast Cell Stabilizer

Use: Labeled Indications

Inhalation: May be used as an adjunct in the prophylaxis of allergic disorders, including asthma; prevention of exercise-induced bronchospasm

Nasal: Prevention and treatment of seasonal and perennial allergic rhinitis

Oral: Systemic mastocytosis

Ophthalmic: Treatment of vernal keratoconjunctivitis, vernal conjunctivitis, and vernal keratitis

Use: Unlabeled/InvestigationalOral: Food allergy, treatment of inflammatory bowel disease

Dosing: Adults

Allergic rhinitis (treatment and prophylaxis): Nasal: Instill 1 spray in each nostril 3-4 times/day

Asthma: For chronic control of asthma, taper frequency to the lowest effective dose (ie, 4 times/day to 3 times/day to twice daily). **Note:** Not effective for immediate relief of symptoms in acute asthmatic attacks; must be used at regular intervals for 2-4 weeks to be effective.

Nebulization solution: Initial: 20 mg 4 times/day; usual dose: 20 mg 3-4 times/day

Metered spray: Initial: 2 inhalations 4 times/day; usual dose: 2-4 inhalations 3-4 times/day

Prophylaxis of bronchospasm (allergen- or exercise-induced):

Note: Administer 10-15 minutes prior to exercise or allergen exposure but no longer than 1 hour before:

Nebulization solution: Single dose of 20 mg

Metered spray: Single dose of 2 inhalations

Conjunctivitis and keratitis: Ophthalmic: 1-2 drops in each eye 4-6 times/day

Mastocytosis: Oral: 200 mg 4 times/day; given $^{1}/_{2}$ hour prior to meals and at bedtime. If control of symptoms is not seen within 2-3 weeks, dose may be increased to a maximum 40 mg/kg/day

Food allergy and inflammatory bowel disease (unlabeled use): Oral: Initial dose: 200 mg 4 times/day; may double the dose if effect is not satisfactory within 2-3 weeks; up to 400 mg 4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Allergic rhinitis (treatment and prophylaxis): Nasal: Children ≥2 years: Refer to adult dosing.

Asthma: Inhalation:

Note: For chronic control of asthma, taper frequency to the lowest effective dose (ie, 4 times/day to 3 times/day to twice daily):

Nebulization solution: Children >2 years: Initial: 20 mg 4 times/day; usual dose: 20 mg 3-4 times/day

Metered spray:

Children 5-12 years: Initial: 2 inhalations 4 times/day; usual dose: 1-2 inhalations 3-4 times/day

Children ≥12 years: Refer to adult dosing.

Prevention of allergen- or exercise-induced bronchospasm:

Note: Administer 10-15 minutes prior to exercise or allergen exposure but no longer than 1 hour before:

Nebulization solution: Children >2 years: Refer to adult dosing.

Metered spray: Children >5 years: Single dose of 2 inhalations

Systemic mastocytosis: Oral:

Children 2-12 years: 100 mg 4 times/day; not to exceed 40 mg/kg/day; given $^1/_2$ hour prior to meals and at bedtime

Children >12 years: Refer to adult dosing.

Food allergy and inflammatory bowel disease (unlabeled use): Oral:

Children <2 years: Not recommended

Children 2-12 years: Initial dose: 100 mg 4 times/day; may double the dose if effect is not satisfactory within 2-3 weeks; not to exceed 40 mg/kg/day

Children >12 years: Refer to adult dosing.

Note: Once desired effect is achieved, dose may be tapered to lowest effective dose

Dosing: Renal ImpairmentSpecific guidelines not available; consider lower dose of oral product.
Dosing: Hepatic ImpairmentSpecific guidelines not available; consider lower dose of oral product.
Administration: OralOral solution: Open ampul and squeeze contents into glass of water; stir well. Administer at least 30 minutes before meals and at bedtime.
Administration: InhalationOral inhalation: Shake canister gently before use; do not immerse canister in water.
Administration: OtherNasal inhalation: Clear nasal passages by blowing nose prior to use.
Dietary ConsiderationsOral: Should be taken at least 30 minutes before meals.
StorageStore at room temperature of 15°C to 30°C (59°F to 86°F); protect from light. Do not use oral solution if solution becomes discolored or forms a precipitate.
CompatibilityNebulizer solution is **compatible** with metaproterenol sulfate, isoproterenol hydrochloride, 0.25% isoetharine hydrochloride, epinephrine hydrochloride, terbutaline sulfate, and 20% acetylcysteine solution for at least 1 hour after their admixture.
ContraindicationsHypersensitivity to cromolyn or any component of the formulation; acute asthma attacks
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Severe anaphylactic reactions may occur rarely

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiac arrhythmias.

Dosage form specific issues:

- Ophthalmic: Transient burning or stinging may occur with ophthalmic use.

- Oral: Use with caution in patients with hepatic or renal impairment; dosage adjustment recommended.

Other warnings/precautions:

- Appropriate use: Prophylactic drug with no benefit for acute situations.

- Withdrawal: Caution should be used when withdrawing the drug or tapering the dose as symptoms may reoccur.

Geriatric ConsiderationsElderly often have difficulty with inhaled and ophthalmic dosage forms.
Pregnancy Risk FactorB
Pregnancy ConsiderationsNo data available on whether cromolyn crosses the placenta or clinical effects on the fetus. Available evidence suggests safe use during pregnancy.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsNo data available on whether cromolyn enters into breast milk or clinical effects on the infant.
Adverse Reactions

Inhalation: >10%: Gastrointestinal: Unpleasant taste in mouth

Nasal:

>10%: Respiratory: Increase in sneezing, burning, stinging, or irritation inside of nose

1% to 10%:

Central nervous system: Headache

Gastrointestinal: Unpleasant taste

Respiratory: Hoarseness, cough, postnasal drip

<1% (Limited to important or life-threatening): Anaphylactic reactions, epistaxis

Ophthalmic: Frequency not defined:

Ocular: Conjunctival injection, dryness around the eye, edema, eye irritation, immediate hypersensitivity reactions, itchy eyes, puffy eyes, styes, rash, watery eyes

Respiratory: Dyspnea

Systemic: Frequency not defined:

Cardiovascular: Angioedema, chest pain, edema, flushing, palpitation, premature ventricular contractions, tachycardia

Central nervous system: Anxiety, behavior changes, convulsions, depression, dizziness, fatigue, hallucinations, headache, irritability, insomnia, lethargy, migraine, nervousness, hypoesthesia, postprandial lightheadedness, psychosis

Dermatologic: Erythema, photosensitivity, pruritus, purpura, rash, urticaria

Gastrointestinal: Abdominal pain, constipation, diarrhea, dyspepsia, dysphagia, esophagospasm, flatulence, glossitis, nausea, stomatitis, unpleasant taste, vomiting

Genitourinary: Dysuria, urinary frequency

Hematologic: Neutropenia, pancytopenia, polycythemia

Hepatic: Liver function test abnormal

Local: Burning

Neuromuscular & skeletal: Arthralgia, leg stiffness, leg weakness, myalgia, paresthesia

Otic: Tinnitus

Respiratory: Dyspnea, pharyngitis

Miscellaneous: Lupus erythematosus

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersPeriodic pulmonary function tests

Nursing: Physical Assessment/MonitoringThis is prophylactic therapy, not to be used for acute situations. Assess results of laboratory tests (long-term use) and adverse reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsPeriodic pulmonary function

Patient EducationOral: Use as directed; do not increase dosage or discontinue abruptly without consulting prescriber. Take at least 30 minutes before meals. You may experience dizziness or nervousness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); diarrhea (boiled milk, yogurt, or buttermilk may help); or headache or muscle pain (mild analgesic may offer relief). Report persistent insomnia; skin rash or irritation; abdominal pain or difficulty swallowing; unusual cough, bronchospasm, or respiratory difficulty; decreased urination; or if condition worsens or fails to improve. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Nebulizer: Store nebulizer solution away from light. Prepare nebulizer according to package instructions. Clear as much mucus as possible before use. Rinse mouth following each use to prevent opportunistic infection and reduce unpleasant aftertaste. Report if symptoms worsen or condition fails to improve.

Nasal: Instill 1 spray into each nostril 3-4 times a day. You may experience unpleasant taste (rinsing mouth and frequent oral care may help); or headache (mild analgesic may help). Report increased sneezing, burning, stinging, or irritation inside of nose; sore throat, hoarseness, nosebleed; anaphylactic reaction (skin rash, fever, chills, backache, respiratory difficulty, chest pain); or worsening of condition or lack of improvement.

Ophthalmic: For ophthalmic use only. Wash hands before using. Tilt head back and look upward. Put drops of suspension inside lower eyelid. Close eye and roll eyeball in all directions. Do not blink for $^{1}/_{2}$ minute. Apply gentle pressure to inner corner of eye for 30 seconds. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Do not share medication with anyone else. Temporary stinging or blurred vision may occur. Inform prescriber if condition worsens or fails to improve or if you experience eye pain, redness, burning, watering, dryness, double vision, puffiness around eye, vision changes, or other adverse eye response; or worsening of condition or lack of improvement. Do not wear contact lenses during treatment.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol, for oral inhalation, as sodium:

Intal®: 800 mcg/inhalation (8.1 g) [112 metered inhalations; 56 doses], (14.2 g) [200 metered inhalations; 100 doses]

Solution for nebulization, as sodium: 20 mg/2 mL (60s, 120s)

Intal®: 20 mg/2 mL (60s, 120s)

Solution, intranasal, as sodium [spray]:

NasalCrom®: 40 mg/mL (13 mL, 26 mL) [5.2 mg/inhalation; contains benzalkonium chloride]

Solution, ophthalmic, as sodium: 4% (10 mL)

Crolom®: 4% (10 mL) [contains benzalkonium chloride]

Solution, oral, as sodium [concentrate]:

Gastrocrom®: 100 mg/5 mL (96s)

Generic AvailableYes: Excludes aerosol, oral solution

Pricing: U.S. (www.drugstore.com)

Aerosol solution (Intal)

800 mcg/ACT (8.1): $83.12

800 mcg/ACT (14.2): $126.43

Concentrate (Gastrocrom)

100 mg/5 mL (480): $279.70

Nebulization (Cromolyn Sodium)

20 mg/2 mL (120): $87.29

Solution (Crolom)

4% (10): $45.99

Solution (Cromolyn Sodium)

4% (10): $31.99

Mechanism of ActionPrevents the mast cell release of histamine, leukotrienes, and slow-reacting substance of anaphylaxis by inhibiting degranulation after contact with antigens

Pharmacodynamics/Kinetics

Onset: Response to treatment:

Nasal spray: May occur at 1-2 weeks

Ophthalmic: May be seen within a few days; treatment for up to 6 weeks is often required

Oral: May occur within 2-6 weeks

Absorption:

Inhalation: ~8% reaches lungs upon inhalation; well absorbed

Oral: <1% of dose absorbed

Half-life elimination: 80-90 minutes

Time to peak, serum: Inhalation: ~15 minutes

Excretion: Urine and feces (equal amounts as unchanged drug); exhaled gases (small amounts)

U.S. Brand NamesAntivenin Polyvalent [Equine] [DSC]

Pharmacologic CategoryAntivenin

Use: Labeled IndicationsNeutralization of venoms of North, Central, and South American crotalids: Rattlesnakes (*Crotalus*, *Sistrurus*); copperhead and cottonmouth moccasins (*Agkistrodon*), including *A. halys* of Korea and Japan; the Fer-de-lance and other species of *Bothrops*; tropical rattler (*Crotalus durissus*), cantil (*A. bilineatus*); bushmaster (*Lachesis mutus*) of South and Central America

Dosing: AdultsCrotalid envenomation: I.M., I.V.:

Initial sensitivity test: 0.02-0.03 mL of a 1:10 dilution of normal horse serum or antivenin given intracutaneously; also give a control test using normal saline in the opposite extremity. A positive reaction occurs within 5-30 minutes. A negative reaction does not rule out the possibility of an immediate or delayed reaction with treatment.

Minimal envenomation: 20-40 mL (2-4 vials)

Moderate envenomation: 50-90 mL (5-9 vials)

Severe envenomation: ≥100-150 mL (10-15 vials)

Note: Variability in the required dose has been reported (5-43 vials administered). The entire initial dose of antivenin should be administered as soon as possible to be most effective (within 4 hours after the bite). I.V. is the preferred route of administration. When administered I.V., infuse the initial 5-10 mL over 3-5 minutes while carefully observing the patient for signs and symptoms of sensitivity reactions. If no reaction occurs, continue infusion at a safe I.V. fluid delivery rate. Additional doses of antivenin are based on clinical response to the initial dose. If swelling continues to progress, symptoms increase in severity, hypotension occurs, or decrease in hematocrit appears, an additional 10-50 mL (1-5 vials) should be administered.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing. **Note:** Clinical trials included patients as young as 11 years of age. Specific pediatric studies have not been conducted. Because the absolute venom dose is expected to be the same in adults and children, adult dosing should be used. Products contain thimerosal, which in high doses has been associated with neurological and renal toxicity. Very young children are most susceptible.

Administration: I.M.May be used in cases of minimal envenomation; I.V. route is preferred. Administer into a large muscle mass, preferably the gluteal area. Avoid nerve trunks. Do not inject into finger or toe.

Administration: I.V. Infuse the initial 5-10 mL dilution over 3-5 minutes while carefully observing the patient for signs and symptoms of sensitivity reactions. If no reaction occurs, continue infusion at a safe I.V. fluid delivery rate. Total dose should be administered as soon as possible.

StorageStore in refrigerator; avoid temperatures >37°C.

ReconstitutionFor I.V. infusion, reconstitute each vial with 10 mL of bacteriostatic water for injection provided with the antivenin. Mix by gentle swirling; use within 48 hours. For prepare for I.V. use, further prepare a 1:1 to 1:10 dilution of reconstituted antivenin in normal saline or D_5W; use within 24 hours.

ContraindicationsHypersensitivity to any component of the formulation, unless the benefits outweigh the risks and appropriate management for anaphylaxis is available

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity: Anaphylaxis and anaphylactoid reactions are possible due to animal proteins in the antivenin; immediate treatment (including epinephrine 1:1000) should be available. Patients should also be monitored for delayed allergic reactions. Antivenin administration should be stopped in patients who develop severe allergic reactions.

- Delayed serum sickness: Delayed serum sickness may occur 1-3 weeks from administration (especially when large doses are used), even with a negative allergic history and absence of reaction to skin test.

Disease-related concerns:

- Snakebite: Should be used within 4-6 hours of snakebite to prevent clinical deterioration and development of coagulation abnormalities. Coagulation abnormalities are due directly to snake venom interference with the coagulation cascade. Recurrent coagulopathy occurs in approximately 50% of patients and may persist for 1-2 weeks or more. Repeat dosing may be indicated. Patients should be monitored for at least 1 week and evaluated for other pre-existing conditions associated with bleeding disorders. In severe rattlesnake bites, a decrease in platelets may occur, lasting hours to several days. Blood products are generally ineffective as they are rapidly consumed by circulating venom.

Dosage form specific issues:

- Product components: Contains phenol and thimerosal. It is made from horse serum; carefully review allergies and history of exposure to products containing horse serum. History of atopic sensitivity to horses may increase risk of immediate sensitivity reactions; use with caution in patients with asthma, hay fever, or urticaria. Use of beta-blockers may also increase the risk of hypersensitivity. A skin test for horse-serum sensitivity should be done prior to treatment; the absence of a skin hypersensitivity reaction does not exclude anaphylaxis or hypersensitivity following antivenin administration. False-negative rate for skin testing is 10% with similar agents. Conversely, hypersensitivity is not an absolute contraindication in a significantly envenomated patient.

Adverse ReactionsFrequency not always defined.

Cardiovascular: Chest pain, hypotension

Central nervous system: Chills

Gastrointestinal: Anorexia, nausea

Respiratory: Asthma, cough, dyspnea, wheezing

Miscellaneous: Allergic reaction, anaphylaxis, hypersensitivity (23% to 56%), serum sickness (up to 50%)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersVital signs; CBC, platelet count, prothrombin time, aPTT, fibrinogen levels, fibrin split products, clot retraction, bleeding and coagulation times, BUN, electrolytes, bilirubin, size of bite area (repeat every 15-30 minutes); intake and output, signs and symptoms of anaphylaxis/allergy. CBC, platelet counts, and clotting studies are evaluated at 6-hour intervals until patient is stable.

Monitoring: Lab TestsCBC, platelet count, prothrombin time, aPTT, fibrinogen levels, fibrin split products, clot retraction, bleeding and coagulation times, BUN, electrolytes, bilirubin. CBC, platelet counts, and clotting studies are evaluated at 6-hour intervals until patient is stable.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution:

Antivenin (Crotalidae) polyvalent: Derived from *Crotalus adamanteus*, *C. atrox*, *C. durissus terrificus*, and *Bothrops atrox* snake venoms [contains phenol and thimerosal; packaged with diluent and normal horse serum for sensitivity testing] [DSC]

Generic AvailableNo

Mechanism of ActionA venom-specific fragment of IgG, which binds and neutralizes venom toxin, helping to remove the toxin from the target tissue and eliminate it from the body.

Pharmacodynamics/Kinetics

Time to peak, serum: I.M.: ≥8 hours

Pharmacotherapy Pearls

Minimal envenomation: Swelling, pain, and bruising are limited to immediate bite site; no systemic signs and symptoms; normal coagulation parameters; no clinical evidence of bleeding.

Moderate envenomation: Swelling, pain, and bruising are limited to less than a full extremity (or <50 cm if bite was on head or trunk); systemic signs and symptoms are not life-threatening (nausea, vomiting, oral paresthesia, unusual taste, mild hypotension, mild tachycardia, tachypnea); coagulation parameters may be abnormal; no bleeding other than minor hematuria, gum bleeding, or nosebleeds, if not severe.

Severe envenomation: Swelling, pain, and bruising involve more than the entire extremity or threaten the airway; systemic signs and symptoms are markedly abnormal (severe alteration of mental status, severe hypotension, severe tachycardia, tachypnea, respiratory insufficiency); coagulation parameters are abnormal; serious bleeding or severe threat of bleeding.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCrotalidae Antivenin; Crotaline Antivenin, Polyvalent; North, Central, and South American Antisnake-Bite Serum; Pit Viper Antivenin; Snake (Pit Vipers) Antivenin

Crotalidae Polyvalent Immune FAB (Ovine)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(kroe TAL ih die pol i VAY lent i MYUN fab (oh vine))
U.S. Brand NamesCroFab™
Pharmacologic CategoryAntivenin
Use: Labeled IndicationsNeutralization of venoms of North American crotalids: Rattlesnakes (*Crotalus*, *Sistrurus*); copperhead and cottonmouth moccasins (*Agkistrodon*)
Dosing: AdultsCrotalid envenomation: Minimal or moderate envenomation: I.V.:

Initial dose: 4-6 vials, dependent upon patient response. Treatment should begin within 6 hours of snakebite; monitor for 1 hour following infusion. Repeat with an additional 4-6 vials if control is not achieved with initial dose. Continue to treat with 4- to 6-vial doses until complete arrest of local manifestations, coagulation tests, and systemic signs are normal. Monitor closely.

Maintenance dose: Once control is achieved, administer 2 vials every 6 hours for up to 18 hours. Optimal dosing past 18 hours has not been established; however, treatment may be continued if deemed necessary based on the patient's condition.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing. **Note:** Clinical trials included patients as young as 11 years of age. Specific pediatric studies have not been conducted. Because the absolute venom dose is expected to be the same in adults and children, adult dosing should be used. Products contain thimerosal, which in high doses has been associated with neurological and renal toxicity. Very young children are most susceptible.
Administration: I.V.Administer I.V. over 60 minutes at a rate of 25-50 mL/hour for the first 10 minutes. If no allergic reaction is observed, increase rate to 250 mL/hour. Monitor closely. Epinephrine and diphenhydramine should be available during the infusion. Decreasing the rate of infusion may help control some adverse effects.
StorageStore between 2°C to 8°C (36°F to 46°F); do not freeze.
ReconstitutionReconstitute each vial with 10 mL sterile water for injection and mix by gentle swirling. Further dilute total dose in 250 mL NS; use within 4 hours of reconstitution.
ContraindicationsHypersensitivity to any component of the formulation (including papaya or papain), unless the benefits outweigh the risks and appropriate management for anaphylaxis is readily available
Warnings/Precautions

Concern related to adverse effects:

- Hypersensitivity reactions: Derived from sheep plasma; anaphylaxis and anaphylactoid reactions are possible, especially in patients with known allergies to sheep protein. Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available. Incidence of acute hypersensitivity reactions may be lower than previously thought (Cannon, 2008). This product lacks the immunogenic Fc fragments and proteins found in the older equine-derived product. Sensitization may occur with repeated doses.

  Processed with papain and may cause hypersensitivity reactions in patients allergic to papaya, other papaya extracts, papain, chymopapain, or the pineapple-enzyme bromelain. There may also be cross allergenicity with dust mite and latex allergens.

Disease-related concerns:

- Snakebite: Should be used within 4-6 hours of snakebite to prevent clinical deterioration and development of coagulation abnormalities. Coagulation abnormalities are due directly to snake venom interference with the coagulation cascade. Recurrent coagulopathy occurs in approximately 50% of patients and may persist for 1-2 weeks or more. Repeat dosing may be indicated. Patients should be monitored for at least 1 week and evaluated for other pre-existing conditions associated with bleeding disorders. In severe rattlesnake bites, a decrease in platelets may occur, lasting hours to several days. Blood products are generally ineffective as they are rapidly consumed by circulating venom.

Special populations:

- Pediatrics: Product contains thimerosal with 0.11 mg of mercury per vial. Developing fetuses and young children may be at higher risk for mercury-related toxicities.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. Products contain thimerosal which may be associated with mercury-related toxicities, including neurological and renal toxicities in the fetus and very young children.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not always defined.

Cardiovascular: Hypotension

Central nervous system: Chills

Dermatologic: Pruritus, rash, urticaria

Respiratory: Asthma, cough, dyspnea, wheezing

Miscellaneous: Anaphylaxis, anaphylactoid reaction, hypersensitivity reactions (5% to 19%)

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersVital signs; CBC, platelet count, prothrombin time, aPTT, fibrinogen levels, fibrin split products, clot retraction, bleeding and coagulation times, BUN, electrolytes, bilirubin; size of bite area (repeat every 15-30 minutes); intake and output; signs and symptoms of anaphylaxis/allergy. CBC, platelet counts, and clotting studies are evaluated at 6-hour intervals until patient is stable.
Monitoring: Lab TestsCBC, platelet count, prothrombin time, aPTT, fibrinogen levels, fibrin split products, clot retraction, bleeding and coagulation times, BUN, electrolytes, bilirubin. CBC, platelet counts, and clotting studies are evaluated at 6-hour intervals until patient is stable.

Medication Safety Issues

Sound-alike/look-alike issues:

Eurax® may be confused with Efudex®, Eulexin®, Evoxac™, Serax®, Urex®

International issues:

Eurax® may be confused with Urex® which is a brand name for furosemide in Australia

Pronunciation(kroe TAM i tonn)

U.S. Brand NamesEurax®

Pharmacologic CategoryScabicidal Agent

Use: Labeled IndicationsTreatment of scabies (*Sarcoptes scabiei*) and symptomatic treatment of pruritus

Dosing: Adults

Scabies: Topical: Wash thoroughly and scrub away loose scales, then towel dry; apply a thin layer and massage drug onto skin of the entire body from the neck to the toes (with special attention to skin folds, creases, and interdigital spaces). Repeat application in 24 hours. Take a cleansing bath 48 hours after the final application. Treatment may be repeated after 7-10 days if live mites are still present.

Pruritus: Topical: Massage into affected areas until medication is completely absorbed; repeat as necessary

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: TopicalFor external use only. Shake lotion well before using. Avoid contact with face, eyes, mucous membranes, and urethral meatus.

StorageStore at room temperature.

ContraindicationsHypersensitivity to crotamiton or any component of the formulation; patients who manifest a primary irritation response to topical medications

Warnings/Precautions

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with face, eyes, mucous membranes, and urethral meatus. Do not apply to acutely inflamed or raw skin.

Geriatric ConsiderationsIf cure is not achieved after 2 doses, use alternative therapy.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted; use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined. Topical:

Dermatologic: Contact dermatitis, pruritus, rash

Local: Local irritation

Miscellaneous: Allergic sensitivity reactions, warm sensation

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate application and use and adverse symptoms to report.

Patient EducationFor topical use only. Avoid eyes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

When used as scabicide, apply lotion and/or cream to whole body from the chin down being sure to cover all skin folds and creases; apply a second application 24 hours later. Take a bath 48 hours after application. All contaminated clothing and bed linen should be washed to avoid reinfestation. If cure is not achieved after 2 doses, use alternative therapy.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cyanocobalamin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(sye an oh koe BAL a min)

U.S. Brand NamesCaloMist™; Nascobal®; Twelve Resin-K

Pharmacologic CategoryVitamin, Water Soluble

Use: Labeled IndicationsTreatment of pernicious anemia; vitamin B_{12} deficiency due to dietary deficiencies or malabsorption diseases, inadequate secretion of intrinsic factor, and inadequate utilization of B_{12} (eg, during neoplastic treatment); increased B_{12} requirements due to pregnancy, thyrotoxicosis, hemorrhage, malignancy, liver or kidney disease

CaloMist™: Maintenance of vitamin B_{12} concentrations after initial correction in patients with B_{12} deficiency without CNS involvement

Dosing: Adults

Recommended intake: 2.4 mcg/day

Pregnancy: 2.6 mcg/day

Lactation: 2.8 mcg/day

Vitamin B_{12} deficiency:

Intranasal:

Nascobal®: 500 mcg in one nostril once weekly

CaloMist™: Maintenance therapy (following correction of vitamin B_{12} deficiency): 25 mcg in each nostril daily (50 mcg/day). If inadequate response, 25 mcg in each nostril twice daily (100 mcg/day).

Oral: 250 mcg/day

I.M., deep SubQ: Initial: 30 mcg/day for 5-10 days; maintenance: 100-200 mcg/month

Pernicious anemia: I.M., deep SubQ (administer concomitantly with folic acid if needed, 1 mg/day for 1 month): 100 mcg/day for 6-7 days; if improvement, administer same dose on alternate days for 7 doses, then every 3-4 days for 2-3 weeks; once hematologic values have returned to normal, maintenance dosage: 100 mcg/month. **Note:** Alternative dosing of 1000 mcg/day for 5 days (followed by 500-1000 mcg/month) has been used.

Hematologic remission (without evidence of nervous system involvement):

Intranasal (Nascobal®): 500 mcg in one nostril once weekly

Oral: 1000-2000 mcg/day

I.M., SubQ: 100-1000 mcg/month

Schilling test: I.M.: 1000 mcg

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Adequate intake:

Children:

0-6 months: 0.4 mcg/day

7-12 months: 0.5 mcg/day

Recommended intake:

Children:

1-3 years: 0.9 mcg/day

4-8 years: 1.2 mcg/day

9-13 years: 1.8 mcg/day

Children >14 years: Refer to adult dosing.

Vitamin B_{12} deficiency: I.M., deep SubQ: Dosage in children is not well established: 0.2 mcg/kg for 2 days, followed by 1000 mcg/day for 2-7 days, followed by 100 mcg/week for one month; for malabsorptive causes of B_{12} deficiency, monthly maintenance doses of 100 mcg have been recommended **or** as an alternative 100 mcg/day for 10-15 days, then once or twice weekly for several months

Pernicious anemia: I.M., deep SubQ (administer concomitantly with folic acid if needed, 1 mg/day for 1 month): 30-50 mcg/day for 2 or more weeks (to a total dose of 1000-5000 mcg), then follow with 100 mcg/month as maintenance dosage

Administration: I.M.I.M. or deep SubQ are preferred routes of administration.

Administration: I.V.Not recommended

Administration: I.V. DetailpH: 4.5-7.0

Administration: OralNot recommended due to variable absorption; however, oral therapy of 1000-2000 mcg/day has been effective for anemia if I.M./SubQ routes refused or not tolerated.

Administration: OtherIntranasal: Nasal spray:

Nascobal®: Prior to initial dose, activate (prime) spray nozzle by pumping unit quickly and firmly until first appearance of spray, then prime twice more. The unit must be reprimed once immediately before each subsequent use. Administer 1 hour before or after ingestion of hot foods/liquids.

CaloMist™: Prime unit by spraying 7 times. If ≥5 days since use, reprime with 2 sprays. Separate from other intranasal medications by several hours.

Dietary ConsiderationsStrict vegetarian diets (eg, without eggs or dairy products) may result in vitamin B_{12} deficiency.

Storage

Injection: Clear pink to red solutions are stable at room temperature. Protect from light.

Intranasal spray: Store at 15°C to 30°C (59°F to 86°F); do not freeze. Protect from light.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, $D_{10}NS$, LR, ${}^1/_2NS$, NS; **variable stability (consult detailed reference)** in TPN.

Y-site administration: Compatible: Heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Compatibility when admixed: Compatible: Ascorbic acid injection, chloramphenicol, metaraminol, vitamin B complex with C. **Incompatible** Chlorpromazine, phytonadione, prochlorperazine edisylate, warfarin.

ContraindicationsHypersensitivity to cyanocobalamin, cobalt, or any component of the formulation

Allergy Considerations

- Cyanocobalamin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Vitamin B_{12} deficiency for >3 months results in irreversible degenerative CNS lesions; neurologic manifestations will not be prevented with folic acid unless vitamin B_{12} is also given. Spinal cord degeneration might also occur when folic acid used as a substitute for vitamin B_{12} in anemia prevention.
- Hypokalemia: Treatment of severe vitamin B_{12} megaloblastic anemia may result in severe hypokalemia, sometimes fatal, due to intracellular potassium shift upon anemia resolution.
- Thrombocytosis: Treatment of severe vitamin B_{12} megaloblastic anemia may result in thrombocytosis.

Disease-related concerns:

- Leber's disease: Use with caution in patients with Leber's disease patients; B_{12} treatment may result in rapid optic atrophy.
- Pernicious anemia: Appropriate use: I.M./SubQ routes are used to treat pernicious anemia; oral and intranasal administration are not indicated until hematologic remission and no signs of nervous system involvement.
- Polycythemia vera: Vitamin B_{12} deficiency masks signs of polycythemia vera; vitamin B_{12} administration may unmask this condition.

Dosage form specific issues:

- Aluminum: Some parenteral products contain aluminum; use caution in patients with impaired renal function and neonates.
- Benzyl alcohol: Some products contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.
- Intranasal administration: Efficacy in patients with nasal pathology or with other concomitant intranasal therapy has not been determined. Use with caution.

Special populations:

- Pediatrics: CaloMist™: Safety and efficacy have not been established in children.

Other warnings/precautions:

- I.V. administration: Avoid intravenous route; anaphylactic shock has occurred.

- Test dose: Intradermal test dose of vitamin B_{12} is recommended for any patient suspected of cyanocobalamin sensitivity prior to intranasal or injectable administration.

Geriatric ConsiderationsThere exists evidence that people, particularly elderly whose serum cobalamin concentrations are <500 pg/mL, should receive replacement parenteral therapy or oral replacement (1000 mcg daily). This recommendation is based upon neuropsychiatric disorders and cardiovascular disorders associated with lower sodium cobalamin concentrations.
Pregnancy Risk FactorA/C (dose exceeding RDA recommendation); C (intranasal)
LactationEnters breast milk/compatible
Breast-Feeding ConsiderationsVegetarian diets which contain no animal products do not supply any vitamin B_{12}. Deficiency recognized in infants of vegetarian mothers who were breast-fed; consider supplementation during breast-feeding.
Adverse ReactionsFrequency not defined.

Cardiovascular: CHF, peripheral vascular disorder, peripheral vascular thrombosis

Central nervous system: Anxiety, dizziness, headache, hypoesthesia, incoordination, pain, nervousness

Dermatologic: Itching, urticaria, exanthema (transient)

Gastrointestinal: Diarrhea, dyspepsia, glossitis, nausea, sore throat, vomiting

Hematologic: Polycythemia vera

Neuromuscular & skeletal: Abnormal gait, arthritis, back pain, myalgia, paresthesia, weakness

Respiratory: Dyspnea, pulmonary edema, rhinitis

Miscellaneous: Anaphylaxis (parenteral) and infection

Drug Interactions

Chloramphenicol: May diminish the therapeutic effect of Cyanocobalamin. The expected hematologic response for the treatment of anemia may be opposed. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Heavy consumption >2 weeks may impair vitamin B_{12} absorption.
Test InteractionsMethotrexate, pyrimethamine, and most antibiotics invalidate folic acid and vitamin B_{12} diagnostic blood assays
Monitoring ParametersVitamin B_{12}, hematocrit, reticulocyte count, folate and iron levels should be obtained prior to treatment; vitamin B_{12} and peripheral blood counts should be monitored 1 month after beginning treatment, then every 3-6 months thereafter.

Megaloblastic anemia: In addition to normal hematological parameters, serum potassium and platelet counts should be monitored during therapy

CaloMist™: If vitamin B_{12} levels declining despite maximum doses then should return to I.M. dosing

Reference RangeNormal range of serum B_{12} is 150-750 pg/mL; this represents 0.1% of total body content. Metabolic requirements are 2-5 mcg/day; years of deficiency required before hematologic and neurologic signs and symptoms are seen. Occasional patients with significant neuropsychiatric abnormalities may have no hematologic abnormalities and normal serum cobalamin levels, 200 pg/mL (SI: >150 pmol/L), or more commonly between 100-200 pg/mL (SI: 75-150 pmol/L).
Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests at beginning of therapy and periodically with long-term therapy. Teach patient proper administration, appropriate nutritional counseling, and adverse symptoms to report.
Monitoring: Lab TestsErythrocyte and reticulocyte count, hemoglobin, hematocrit; monitor potassium concentrations during early therapy
Patient EducationUse exactly as directed. Pernicious anemia may require treatment for life. Report skin rash; swelling, pain, or redness of extremities; or acute persistent diarrhea. **Pregnancy precaution:** Inform prescriber if you are pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 1000 mcg/mL (1 mL, 10 mL, 30 mL) [may contain benzyl alcohol]

Lozenge: 50 mcg, 100 mcg, 250 mcg, 500 mcg

Lozenge, sublingual: 500 mcg

Solution, intranasal [spray]:

CaloMist™: 25 mcg/0.1 mL actuation (18 mL) [contains benzyl alcohol, benzalkonium chloride; 60 metered sprays]

Nascobal®: 500 mcg/0.1 mL actuation (2.3 mL) [contains benzalkonium chloride; delivers 8 sprays]

Tablet: 50 mcg, 100 mcg, 250 mcg, 500 mcg, 1000 mcg

Twelve Resin-K: 1000 mcg [may be used as oral, sublingual, or buccal]

Tablet, timed release: 1000 mcg, 1500 mcg

Tablet, sublingual: 1000 mcg, 2500 mcg, 5000 mcg

Generic AvailableYes: Excludes nasal spray
Pricing: U.S. (www.drugstore.com)

Gel (Nascobal)

500 mcg/0.1 mL (2.3): $146.96

Solution (Cyanocobalamin)

1000 mcg/mL (25): $35.99

1000 mcg/mL (30): $19.99

Solution (Nascobal)

500 mcg/0.1 mL (2.3): $213.58

Tablets (Vitamin B-12)

500 mcg (100): $12.99

1000 mcg (100): $12.99

Mechanism of ActionCoenzyme for various metabolic functions, including fat and carbohydrate metabolism and protein synthesis, used in cell replication and hematopoiesis

Pharmacodynamics/Kinetics

Absorption: Oral: Variable from the terminal ileum; requires the presence of calcium and gastric “intrinsic factor” to transfer the compound across the intestinal mucosa

Distribution: Principally stored in the liver and bone marrow, also stored in the kidneys and adrenals

Protein binding: Transcobalamins

Metabolism: Converted in tissues to active coenzymes, methylcobalamin and deoxyadenosylcobalamin; undergoes some enterohepatic recycling

Bioavailability: Intranasal solution: Nascobal®: 6.1% (relative to I.M.)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentAnticonvulsants may decrease the absorption of cyanocobalamin

Cardiovascular ConsiderationsEpidemiological evidence suggests that total plasma homocysteine level may be an independent cardiovascular risk factor. Plasma homocysteine levels are strongly influenced by genetics and diet (folic acid, pyridoxine/vitamin B_6, and cyanocobalamine/vitamin B_{12}). These vitamins help to break down homocysteine in the body.

Schnyder, et al, studied the effects of homocysteine-lowering therapy (folic acid 1 mg/day, vitamin B_6 10 mg/day, vitamin B_{12} 0.4 mg/day) in patients with coronary artery disease after successful angioplasty in the Swiss Heart Study. This randomized, double-blind, placebo-controlled trial looked at a composite endpoint (death, nonfatal MI, repeat revascularization) 6 months and 1 year after angioplasty. Homocysteine-lowering therapy significantly decreased the incidence of major adverse events, primarily due to a reduced rate of target lesion revascularization. Investigators in the Folate After Coronary Intervention Trial randomized patients who underwent successful coronary stenting procedures to placebo or folic acid (1.2 mg/day), vitamin B_6 (4.8 mg/day), and vitamin B_{12} (0.06 mg/day). Vitamin supplementation was associated with increased restenosis in these PCI patients.

Cyclizine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(SYE kli zeen)
U.S. Brand NamesMarezine速 [OTC]
Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation
Use: Labeled IndicationsPrevention and treatment of nausea, vomiting, and vertigo associated with motion sickness; control of postoperative nausea and vomiting
Dosing: AdultsEmesis (prophylaxis and treatment): Oral: 50 mg taken 30 minutes before departure, may repeat in 4-6 hours if needed, up to 200 mg/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricEmesis (prophylaxis and treatment): Oral: Children 6-12 years: 25 mg up to 3 times/day
ContraindicationsHypersensitivity to cyclizine or any component of the formulation
Geriatric ConsiderationsDue to anticholinergic action, use lowest dose in divided doses to avoid side effects and their inconvenience; limit use if possible; may cause confusion or aggravate symptoms of confusion in those with dementia; constipation and difficulty voiding urine may occur
Pregnancy Risk FactorB
Adverse Reactions

>10%:

Central nervous system: Drowsiness

Gastrointestinal: Xerostomia

1% to 10%:

Central nervous system: Headache

Dermatologic: Dermatitis

Gastrointestinal: Nausea

Genitourinary: Urinary retention

Ocular: Diplopia

Renal: Polyuria

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 50 mg

Generic AvailableNo
Mechanism of ActionCyclizine is a piperazine derivative with properties of histamines. The precise mechanism of action in inhibiting the symptoms of motion sickness is not known. It may have effects directly on the labyrinthine apparatus and central actions on the labyrinthine apparatus and on the chemoreceptor trigger zone. Cyclizine exerts a central anticholinergic action.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may exacerbate the dry mouth and sedation commonly seen with cyclizine

Index TermsCyclizine Hydrochloride; Cyclizine Lactate

International Brand NamesCyclizine FNA (NL); Echnatol (AT); Fortravel (AT); Maremal (ES); Marzine (CH, DK, FI, IT, NL, NO, SE); Nausicalm (NZ); Norizine (ZA); Valoid (GB, IE)

Cyclobenzaprine

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

> Cyclobenzaprine may be confused with cycloSERINE, cyproheptadine
>
> Flexeril® may be confused with Floxin®

Pronunciation(sye kloe BEN za preen)
U.S. Brand NamesAmrix®; Fexmid™; Flexeril®
Canadian Brand NamesApo-Cyclobenzaprine®; Flexeril®; Flexitec; Gen-Cyclobenzaprine; Novo-Cycloprine; Nu-Cyclobenzaprine
Pharmacologic CategorySkeletal Muscle Relaxant
Use: Labeled IndicationsTreatment of muscle spasm associated with acute painful musculoskeletal conditions
Use: DentalTreatment of muscle spasm associated with acute temporomandibular joint pain (TMJ)
Dosing: AdultsMuscle spasm (including spasms associated with acute temporomandibular joint pain): Oral: **Note:** Do not use longer than 2-3 weeks

Capsule, extended release: Usual: 15 mg once daily; some patients may require up to 30 mg once daily

Tablet, immediate release: Initial: 5 mg 3 times/day; may increase to 7.5-10 mg 3 times/day if needed

Dosing: Elderly

Capsule, extended release: Use not recommended

Tablet, immediate release: Initial: 5 mg; titrate dose slowly and consider less frequent dosing

Dosing: PediatricMuscle spasm (including spasms associated with acute temporomandibular joint pain):

Capsule, extended release: Children <18 years: Dosage not established.

Tablet, immediate release: Children ≥15 years: Refer to adult dosing.

Dosing: Hepatic Impairment
Capsule, extended release: Mild-to-severe impairment: Use not recommended.

Tablet, immediate release:

> Mild impairment: Initial: 5 mg; use with caution; titrate slowly and consider less frequent dosing
>
> Moderate-to-severe impairment: Use not recommended

Administration: OralExtended release capsules: Administer at the same time each day. Do not crush or chew.
Storage

Amrix®, Flexeril®: Store at room temperature of 15°C to 30°C (59°F to 86°F).

Fexmid™: Store at room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to cyclobenzaprine or any component of the formulation; do not use concomitantly or within 14 days of MAO inhibitors; hyperthyroidism; congestive heart failure, arrhythmias, heart block; acute recovery phase of MI
Allergy Considerations

- Cyclobenzaprine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Toxic potential similar to tricyclic antidepressants: Cyclobenzaprine shares the toxic potentials of the tricyclic antidepressants, including prolongation of conduction time, arrhythmias, and tachycardia; the usual precautions of tricyclic antidepressant therapy should be observed.

Disease-related concerns:

- Glaucoma: Use with caution in patients with angle-closure glaucoma or increased intraocular pressure.

- Hepatic impairment: Use with caution in patients with mild hepatic impairment; plasma concentrations increased twofold in presence of mild impairment. Not recommended in moderate-to-severe hepatic impairment. Extended release capsules not recommended in patients with hepatic impairment of any severity (mild, moderate, or severe).

- Urinary hesitancy/retention: Use with caution in patients with urinary hesitancy or retention.

Concurrent drug therapy issues:

- MAO inhibitors: Do not use concomitantly or within 14 days after MAO inhibitors; combination may cause hypertensive crisis and/or severe convulsions.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; plasma concentrations and incidence of adverse reactions are increased in the elderly compared to younger adults. Extended release capsules not recommended for use in elderly.

- Pediatrics: Safety and efficacy have not been established in patients <15 years of age.

Geriatric ConsiderationsHigh doses in the elderly caused drowsiness and dizziness; therefore, use the lowest dose possible. Because cyclobenzaprine causes anticholinergic effects, it may not be the skeletal muscle relaxant of choice in the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Drowsiness (29% to 39%), dizziness (1% to 11%)

Gastrointestinal: Xerostomia (6% to 32%)

1% to 10%:

Central nervous system: Fatigue (1% to 6%), confusion (1% to 3%), headache (1% to 3%), irritability (1% to 3%), mental acuity decreased (1% to 3%), nervousness (1% to 3%), somnolence (1% to 2%)

Gastrointestinal: Abdominal pain (1% to 3%), constipation (1% to 3%), diarrhea (1% to 3%), dyspepsia (≤4%), nausea (1% to 3%), unpleasant taste (1% to 3%)

Neuromuscular & skeletal: Weakness (1% to 3%)

Ocular: Blurred vision (1% to 3%)

Respiratory: Pharyngitis (1% to 3%), upper respiratory infection (1% to 3%)

<1% (Limited to important or life-threatening): Ageusia, agitation, anaphylaxis, angioedema, anorexia, anxiety, arrhythmia, ataxia, cholestasis, depression, diaphoresis, diplopia, disorientation, dysarthria, facial edema, flatulence, gastritis, hallucinations, hepatitis (rare), hypertonia, hypotension, insomnia, jaundice, liver function tests abnormal, malaise, muscle twitching, palpitation, paresthesia, pruritus, psychosis, rash, seizure, syncope, tachycardia, thirst, tinnitus, tongue edema, tremor, urinary retention, urticaria, vasodilation, vertigo, vomiting

Metabolism/Transport Effects**Substrate** of CYP1A2 (major), 2D6 (minor), 3A4 (minor)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

MAO Inhibitors: Cyclobenzaprine may enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Food increases bioavailability (peak plasma concentrations increased by 35% and area under the curve by 20%) of the extended release capsule.

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy (according to rationale for therapy) and adverse reactions at beginning and periodically during therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects (postural hypotension precautions), and adverse symptoms to report.

Patient EducationTake exactly as directed. Do not increase dose or discontinue this medication without consulting prescriber. Do not use alcohol, prescriptive or OTC antidepressants, sedatives, or pain medications without consulting prescriber. You may experience drowsiness, dizziness, lightheadedness (avoid driving or engaging in tasks that require alertness until response to drug is known); or urinary retention (void before taking medication). Report excessive drowsiness or mental agitation, chest pain, skin rash, swelling of mouth/face, difficulty speaking, ringing in ears, or blurred vision. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release, as hydrochloride:

Amrix®: 15 mg, 30 mg

Tablet, as hydrochloride: 5 mg, 10 mg

Fexmid™: 7.5 mg

Flexeril®: 5 mg, 10 mg

Generic AvailableYes: Excludes capsule

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Amrix)

15 mg (60): $515.98

Tablets (Cyclobenzaprine HCl)

5 mg (30): $13.99

10 mg (30): $13.99

Tablets (Flexeril)

5 mg (30): $55.99

10 mg (30): $58.99

Mechanism of ActionCentrally-acting skeletal muscle relaxant pharmacologically related to tricyclic antidepressants; reduces tonic somatic motor activity influencing both alpha and gamma motor neurons

Pharmacodynamics/Kinetics

Onset of action: Immediate release tablet: ~1 hour

Duration: Immediate release tablet: 12-24 hours

Absorption: Complete

Metabolism: Hepatic via CYP3A4, 1A2, and 2D6; may undergo enterohepatic recirculation

Bioavailability: 33% to 55%

Half-life elimination: Range: 8-37 hours; Immediate release tablet: 18 hours; Extended release capsule: 32 hours

Time to peak, serum: Immediate release tablet: 3-8 hours; Extended release capsule: 7-8 hours

Excretion: Urine (as inactive metabolites); feces (as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may cause nervousness or confusion

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors or within 14 days of MAO inhibitor; concurrent use with psychotropics may exacerbate the dry mouth and sedation commonly seen with cyclobenzaprine

Index TermsCyclobenzaprine Hydrochloride

Cyclopentolate and Phenylephrine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(sye kloe PEN toe late & fen il EF rin)
U.S. Brand NamesCyclomydril速
Pharmacologic CategoryOphthalmic Agent, Antiglaucoma
Use: Labeled IndicationsInduce mydriasis greater than that produced with cyclopentolate HCl alone
Dosing: AdultsDiagnostic aid (mydriasis and cycloplegia): Ophthalmic: Instill 1 drop into the eye every 5-10 minutes, for up to 3 doses, approximately 40-50 minutes before the examination
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricDiagnostic aid: Ophthalmic: Neonates, Infants, Children: Refer to adult dosing.
Administration: OtherFinger pressure should be applied to lacrimal sac for 1-2 minutes after instillation to decrease risk of absorption and systemic reactions.
StorageStore in tight containers and protect from light.
Pregnancy Risk FactorC
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: Cyclopentolate hydrochloride 0.2% and phenylephrine hydrochloride 1% (2 mL, 5 mL) [contains benzalkonium chloride]

Generic AvailableNo
Pharmacodynamics/KineticsSee individual agents.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusCyclopentolate may cause restlessness, hallucinations, psychosis, hyperactivity, seizures, incoherent speech, or ataxia. The 2% solution may result in psychotic reactions and behavioral disturbances in children, usually occurring approximately 30-45 minutes after instillation.
Mental Health: Effects on Psychiatric TreatmentNone reported; may counteract the effects of antipsychotics, especially in children; monitor
Index TermsPhenylephrine and Cyclopentolate

Cyclopentolate

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(sye kloe PEN toe late)
U.S. Brand NamesAK-Pentolate™; Cyclogyl®; Cylate™
Canadian Brand NamesCyclogyl®; Diopentolate®
Pharmacologic CategoryAnticholinergic Agent, Ophthalmic
Use: Labeled IndicationsDiagnostic procedures requiring mydriasis and cycloplegia
Dosing: AdultsDiagnostic aid (mydriasis and cycloplegia): Ophthalmic: Instill 1 drop of 1% followed by another drop in 5 minutes; 2% solution in heavily pigmented iris
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricDiagnostic aid (mydriasis and cycloplegia): Ophthalmic:

Neonates and Infants: **Note:** Cyclopentolate and phenylephrine combination formulation is the preferred agent for use in neonates and infants due to lower cyclopentolate concentration and reduced risk for systemic reactions

Children: Instill 1 drop of 0.5%, 1%, or 2% in eye followed by 1 drop of 0.5% or 1% in 5 minutes, if necessary

StorageStore in tight containers.
ContraindicationsHypersensitivity to cyclopentolate or any component of the formulation; untreated narrow-angle glaucoma; presence of untreated anatomically narrow angles
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause CNS disturbances, especially with the higher concentrations. May occur with any age group, although children are more susceptible.

- Intraocular pressure: May cause a transient elevation in intraocular pressure.

Disease-related concerns:

- Down syndrome: Patients with Down syndrome are predisposed to angle-closure glaucoma; use with caution.

Special populations:

- Contact lens wearers: Contains benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting.

- Elderly: Use with caution in the elderly; may be predisposed to increased intraocular pressure.

- Pediatrics: May result in psychotic reactions and behavioral disturbances in children, especially with the 2% solution; effects usually occur ~30-45 minutes after instillation; observe infants for at least 30 minutes following instillation. Feeding intolerance may occur in infants; withhold feeding for 4 hours after examination.

Other warnings and precautions:

- Appropriate use: For topical ophthalmic use only. To minimize absorption, use only 1 drop of solution per eye, followed by pressure applied over the nasolacrimal sac for 2-3 minutes.

Pregnancy Risk FactorC
Adverse Reactions1% to 10%:

Cardiovascular: Tachycardia

Central nervous system: Ataxia, hallucinations, hyperactivity, incoherent speech, psychosis, restlessness, seizure

Dermatologic: Burning sensation

Ocular: Intraocular pressure increased, loss of visual accommodation

Miscellaneous: Allergic reaction

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Cyclopentolate HCl)

1% (2): $9.99

1% (15): $8.99

Mechanism of ActionPrevents the muscle of the ciliary body and the sphincter muscle of the iris from responding to cholinergic stimulation, causing mydriasis and cycloplegia

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Cycloplegia: 25-75 minutes; Mydriasis: 30-60 minutes

Duration: ≤24 hours

Related Information

- Cycloplegic Mydriatics

Medication Safety Issues

Sound-alike/look-alike issues:

Cyclophosphamide may be confused with cycloSPORINE, ifosfamide

Cytoxan® may be confused with cefoxitin, Centoxin®, Ciloxan®, cytarabine, CytoGam®, Cytosar®, Cytosar-U®, Cytotec®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(sye kloe FOS fa mide)

U.S. Brand NamesCytoxan® [DSC]

Canadian Brand NamesCytoxan®; Procytox®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent; Antirheumatic, Miscellaneous

Use: Labeled Indications

Oncologic: Treatment of Hodgkin's and non-Hodgkin's lymphoma, Burkitt's lymphoma, chronic lymphocytic leukemia (CLL), chronic myelocytic leukemia (CML), acute myelocytic leukemia (AML), acute lymphocytic leukemia (ALL), mycosis fungoides, multiple myeloma, neuroblastoma, retinoblastoma, rhabdomyosarcoma, Ewing's sarcoma; breast, testicular, endometrial, ovarian, and lung cancers, and in conditioning regimens for bone marrow transplantation

Nononcologic: Prophylaxis of rejection for kidney, heart, liver, and bone marrow transplants, severe rheumatoid disorders, nephrotic syndrome, Wegener's granulomatosis, idiopathic pulmonary hemosideroses, myasthenia gravis, multiple sclerosis, systemic lupus erythematosus, lupus nephritis, autoimmune hemolytic anemia, idiopathic thrombocytic purpura (ITP), macroglobulinemia, and antibody-induced pure red cell aplasia

Use: DentalTreatment of Wegener's granulomatosis, systemic lupus erythematosus

Dosing: AdultsRefer to individual protocols.

Usual dose:

Oral: 50-100 mg/m^2/day as continuous therapy or 400-1000 mg/m^2 in divided doses over 4-5 days as intermittent therapy

I.V.:

Single doses: 400-1800 mg/m^2 (30-50 mg/kg) per treatment course (1-5 days) which can be repeated at 2- to 4-week intervals

Continuous daily doses: 60-120 mg/m^2 (1-2.5 mg/kg) per day

JRA/vasculitis: I.V.: 10 mg/kg every 2 weeks

High dose BMT:

I.V.:

60 mg/kg/day for 2 days (total dose: 120 mg/kg)

50 mg/kg/day for 4 days (total dose: 200 mg/kg)

1.8 g/m^2/day for 4 days (total dose: 7.2 g/m^2)

Continuous I.V.:

1.5 g/m^2/24 hours for 96 hours (total dose: 6 g/m^2)

1875 mg/m^2/24 hours for 72 hours (total dose: 5625 mg/m^2)

Note: Duration of infusion is 1-24 hours; generally combined with other high-dose chemotherapeutic drugs, lymphocyte immune globulin, or total body irradiation (TBI).

Nephrotic syndrome: Oral: 2-3 mg/kg/day every day for up to 12 weeks when corticosteroids are unsuccessful

Dosing: ElderlyRefer to individual protocols: Initial and maintenance for induction: 1-2 mg/kg/day; adjust for renal clearance.

Dosing: PediatricRefer to individual protocols. Children:

Chemotherapy: Refer to adult dosing.

SLE: I.V.: 500-750 mg/m^2 every month; maximum dose: 1 g/m^2

JRA/vasculitis: I.V.: Refer to adult dosing.

Nephrotic syndrome: Refer to adult dosing.

Dosing: Renal ImpairmentThe FDA-approved labeling states there is insufficiant evidence to recommend dosage adjustment and therefore, does not contain renal dosing adjustment guidelines. The following guidelines have been used by some clinicians (Aronoff, 2007): Children and Adults:

Cl_{cr} <10 mL/minute: Administer 75% of normal dose

Hemodialysis effects: Moderately dialyzable (20% to 50%)

Administer 50% of dose posthemodialysis

Continuous ambulatory peritoneal dialysis (CAPD): Administer 75% of normal dose

Continuous renal replacement therapy (CRRT): Administer 100% of normal dose

Dosing: Hepatic ImpairmentThe pharmacokinetics of cyclophosphamide are not significantly altered in the presence of hepatic insufficiency. The FDA-approved labeling does not contain hepatic dosing adjustment guidelines. The following guidelines have been used by some clinicians (Floyd, 2006):

Serum bilirubin 3.1-5 mg/dL or ALT/AST >3 times ULN: Administer 75% of dose

Serum bilirubin >5 mg/mL: Avoid use

Dosing: Combination Regimens

Continuous I.V.: 1.5 g/m^2/24 hours for 96 hours (total dose: 6 g/m^2)

Duration of infusion is 1-24 hours; generally combined with other high-dose chemotherapeutic drugs, lymphocyte immune globulin, or total body irradiation (TBI).

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.I.P., intrapleurally, IVPB, or continuous intravenous infusion; I.V. infusions may be administered over 1-24 hours. Doses >500 mg to approximately 2 g may be administered over 20-30 minutes.

To minimize bladder toxicity, increase normal fluid intake during and for 1-2 days after cyclophosphamide dose. Most adult patients will require a fluid intake of at least 2 L/day. High-dose regimens should be accompanied by vigorous hydration with or without mesna therapy.

Administration: I.V. DetailSlow IVP in doses ≤1 g. High-dose regimens should be accompanied by vigorous hydration with or without mesna therapy.

BMT only: Approaches to reduction of hemorrhagic cystitis include infusion of 0.9% NaCl 3 L/m^2/24 hours, infusion of 0.9% NaCl 3 L/m^2/24 hours with continuous 0.9% NaCl bladder irrigation 300-1000 mL/hour, and infusion of 0.9% NaCl 1.5-3 L/m^2/24 hours with intravenous mesna. Hydration should begin at least 4 hours before cyclophosphamide and continue at least 24 hours after completion of cyclophosphamide. The dose of daily mesna used should equal the daily dose of cyclophosphamide. Mesna can be administered as a continuous 24-hour intravenous infusion or be given in divided doses every 4 hours. Mesna should begin at the start of treatment, and continue at least 24 hours following the last dose of cyclophosphamide.

pH: 3-9 (reconstituted solution)

Administration: OralTablets are not scored and should not be cut or crushed. To minimize the risk of bladder irritation, do not administer tablets at bedtime.

Dietary ConsiderationsTablets should be administered during or after meals.

StorageStore intact vials of powder at room temperature of 15°C to 30°C (59°F to 86°F). Reconstituted solutions are stable for 24 hours at room temperature and 6 days under refrigeration 2°C to 8°C (36°F to 46°F). Further dilutions in D_5W or NS are stable for 24 hours at room temperature (25°C) and 6 days at refrigeration.

ReconstitutionReconstitute vials with SWI, NS, or D_5W to a concentration of 20 mg/mL.

CompatibilityStable in D_5LR, D_5NS, D_5W, LR, $^1/_2$NS, NS.

Y-site administration: Compatible: Allopurinol, amifostine, amikacin, ampicillin, azlocillin, aztreonam, bleomycin, cefamandole, cefazolin, cefepime, cefoperazone, cefotaxime, cefoxitin, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisplatin, cladribine, clindamycin, co-trimoxazole, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, erythromycin lactobionate, etoposide phosphate, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, hydromorphone, idarubicin, kanamycin, leucovorin, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone sodium succinate, metoclopramide, metronidazole, minocycline, mitomycin, morphine, nafcillin, ondansetron, oxacillin, paclitaxel, penicillin G potassium, piperacillin, piperacillin/tazobactam, prochlorperazine edisylate, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, topotecan, vancomycin, vinblastine, vincristine, vinorelbine. **Incompatible:** Amphotericin B cholesteryl sulfate complex.

Compatibility in syringe: Compatible: Bleomycin, cisplatin, doxapram, doxorubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine.

Compatibility when admixed: Compatible: Cisplatin with etoposide, dacarbazine, fluorouracil, hydroxyzine, mesna, methotrexate, methotrexate with fluorouracil, mitoxantrone, ondansetron.

Extemporaneously PreparedA 2 mg/mL oral elixir was stable for 14 days when refrigerated when made as follows: Reconstitute a 200 mg vial with aromatic elixir, withdraw the solution, and add sufficient aromatic elixir to make a final volume of 100 mL (store in amber glass container).

Brook D, Davis RE, and Bequette RJ, "Chemical Stability of Cyclophosphamide in Aromatic Elixir U.S.P.," *Am J Health Syst Pharm*, 1973, 30:618-20.

ContraindicationsHypersensitivity to cyclophosphamide or any component of the formulation; pregnancy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Cardiotoxicity: May cause cardiotoxicity (HF, usually with higher doses).
- Fertility effects: May impair fertility; interferes with oogenesis and spermatogenesis.
- Hemorrhagic cystitis: May occur; increased hydration and frequent voiding is recommended.
- Immunosuppression: Monitor for infections; immunosuppression may occur.
- Secondary malignancies: With use secondary malignancies (usually delayed) have been reported.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment may be needed.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment may be needed.

Concurrent drug therapy issues:

- Anthracyclines: May potentiate the cardiotoxicity of anthracyclines.

Geriatric ConsiderationsToxicity to immunosuppressives is increased in the elderly. Start with lowest recommended adult doses. Signs of infection, such as fever and WBC rise, may not occur. Lethargy and confusion may be more prominent signs of infection; adjust dose for renal function.

Pregnancy Risk FactorD

LactationEnters breast milk/contraindicated

Adverse Reactions

>10%:

Dermatologic: Alopecia (40% to 60%) but hair will usually regrow although it may be a different color and/or texture. Hair loss usually begins 3-6 weeks after the start of therapy.

Endocrine & metabolic: Fertility: May cause sterility; interferes with oogenesis and spermatogenesis; may be irreversible in some patients; gonadal suppression (amenorrhea)

Gastrointestinal: Nausea and vomiting (usually beginning 6-10 hours after administration); anorexia, diarrhea, mucositis, and stomatitis are also seen

Genitourinary: Severe, potentially fatal, acute hemorrhagic cystitis or urinary fibrosis (7% to 40%)

Hematologic: Thrombocytopenia and anemia are less common than leukopenia

Onset: 7 days

Nadir: 10-14 days

Recovery: 21 days

1% to 10%:

Cardiovascular: Facial flushing

Central nervous system: Headache

Dermatologic: Skin rash

Renal: SIADH may occur, usually with doses >50 mg/kg (or 1 g/m^2); renal tubular necrosis, which usually resolves with discontinuation of the drug, is also reported

Respiratory: Nasal congestion occurs when I.V. doses are administered too rapidly; patients experience runny eyes, rhinorrhea, sinus congestion, and sneezing during or immediately after the infusion.

<1%, postmarketing, and/or case reports: High-dose therapy may cause cardiac dysfunction manifested as CHF; cardiac necrosis or hemorrhagic myocarditis has occurred rarely, but may be fatal. Interstitial pneumonitis and pulmonary fibrosis are occasionally seen with high doses. Cyclophosphamide may also potentiate the cardiac toxicity of anthracyclines. Other adverse reactions include anaphylactic reactions, darkening of skin/fingernails, dizziness, hemorrhagic colitis, hemorrhagic ureteritis, hepatotoxicity, hyperuricemia, hypokalemia, jaundice, malaise, neutrophilic eccrine hidradenitis, radiation recall, renal tubular necrosis, secondary malignancy (eg, bladder carcinoma), SAIDH, Stevens-Johnson syndrome, toxic epidermal necrolysis, weakness.

Oncology: VesicantNo

Oncology: Emetic Potential

Very high (>90%): >1500 mg/m^2

High (60% to 90%): >750 mg/m^2, ≤1500 mg/m^2

Moderate (30% to 60%): ≤750 mg/m^2

Oral: Moderate (30% to 60%)

Oncology: Bone Marrow - Unique Toxicity

Cardiovascular: Heart failure, cardiac necrosis, pericardial tamponade, heart block

Endocrine & metabolic: Hyponatremia, acquired pseudocholinesterase deficiency, transient diabetes insipidus

Hematologic: Methemoglobinemia

Neuromuscular & skeletal: Rhabdomyolysis

Respiratory: Pleural effusion, interstitial pneumonitis

Metabolism/Transport Effects**Substrate** of CYP2A6 (minor), 2B6 (major), 2C9 (minor), 2C19 (minor), 3A4 (major); **Inhibits** CYP3A4 (weak); **Induces** CYP2B6 (weak), 2C8 (weak), 2C9 (weak)

Drug Interactions

Allopurinol: May enhance the adverse/toxic effect of Cyclophosphamide. Specifically, bone marrow suppression. *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Etanercept: May enhance the adverse/toxic effect of Cyclophosphamide. An increased risk of solid cancer development may be present. *Risk D: Consider therapy modification*

Mivacurium [Off Market]: Cyclophosphamide may decrease the metabolism of Mivacurium [Off Market]. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Pentostatin: May enhance the cardiotoxic effect of Cyclophosphamide. *Risk C: Monitor therapy*

Succinylcholine: Cyclophosphamide may decrease the metabolism of Succinylcholine. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid black cohosh, dong quai in estrogen-dependent tumors.

Monitoring ParametersCBC with differential and platelet count, BUN, UA, serum electrolytes, serum creatinine

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions (eg, potential for increased or prolonged nephrotoxicity, cardiotoxicity). Note infusion specifics in Administration; including recommendations for pre- and posthydration. Infusion site must be monitored to prevent extravasation. Assess results of laboratory tests (eg, urinalysis, BUN, and serum creatinine [detect nephrotoxicity]; CBC with differential and platelet count [detect myelosuppression]). Evaluate therapeutic effectiveness (according to purpose for use) and adverse response (hemorrhagic cystitis, leukopenia, renal tubular necrosis) prior to each infusion and regularly during therapy. Teach patient (or caregiver) proper use (oral), possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet count, ESR, BUN, UA, serum electrolytes, serum creatinine

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed, during or after meals; do not take at night. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and void frequently to reduce incidence of bladder irritation. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause loss of hair (reversible, although regrowth hair may be different color or texture); infertility or amenorrhea; nausea or vomiting (small, frequent meals, good mouth care, chewing gum, or sucking lozenges may help - if persistent consult prescriber for antiemetic); headache (consult prescriber for analgesic); nasal congestion or cold symptoms (consult prescriber for decongestant); or mouth sores (use soft toothbrush or cotton swab for oral care). Report any difficulty or pain with urination; chest pain, rapid heartbeat, or palpitations; easy bruising or bleeding; unusual rash; persistent nausea or vomiting; menstrual irregularities; swelling of extremities; respiratory difficulty; or unusual fatigue. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution: 500 mg, 1 g, 2 g

Cytoxan®: 500 mg, 1 g, 2 g [DSC]

Tablet: 25 mg, 50 mg

Cytoxan®: 25 mg, 50 mg [DSC]

Generic AvailableYes

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Tablets (Cyclophosphamide)

25 mg (30): $60.99

50 mg (30): $106.99

Tablets (Cytoxan)

50 mg (30): $125.99

Mechanism of ActionCyclophosphamide is an alkylating agent that prevents cell division by cross-linking DNA strands and decreasing DNA synthesis. It is a cell cycle phase nonspecific agent. Cyclophosphamide also possesses potent immunosuppressive activity. Cyclophosphamide is a prodrug that must be metabolized to active metabolites in the liver.

Pharmacodynamics/Kinetics

Absorption: Oral: Well absorbed

Distribution: V_d: 0.48-0.71 L/kg; crosses placenta; crosses into CSF (not in high enough concentrations to treat meningeal leukemia)

Protein binding: 10% to 60%

Metabolism: Hepatic to active metabolites acrolein, 4-aldophosphamide, 4-hydroperoxycyclophosphamide, and nor-nitrogen mustard

Bioavailability: >75%

Half-life elimination: 3-12 hours

Time to peak, serum: Oral: ~1 hour

Excretion: Urine (<30% as unchanged drug, 85% to 90% as metabolites)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsIn patients with CYP2B6 G516T variant allele, cyclophosphamide metabolism is markedly increased; metabolism is not influenced by CYP2C9 and CYP2C19 isotypes.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

Cardiovascular ConsiderationsRare but potentially life-threatening cardiovascular side effects may occur at higher doses (>200 mg/m^2) including heart failure, cardiac necrosis, myocarditis, arrhythmias, tamponade, and pulmonary fibrosis. The dose should be based on indications, concomitant diseases (ie, renal dysfunction), and potential drug interactions.

Oncology: Bone Marrow CommentsApproaches to reduction of hemorrhagic cystitis include infusion of 0.9% NaCl 3 L/m^2/24 hours, infusion of 0.9% NaCl 3 L/m^2/24 hours with continuous 0.9% NaCl bladder irrigation 300-1000 mL/hour, and infusion of 0.9% NaCl 1.5-3 L/m^2/24 hours with intravenous mesna. Hydration should begin at least 4 hours before cyclophosphamide and continue at least 24 hours after completion of cyclophosphamide. The dose of daily mesna used should equal the daily dose of cyclophosphamide. Mesna can be administered as a continuous 24-hour intravenous infusion or be given in divided doses every 4 hours. Mesna should begin at the start of treatment, and continue at least 24 hours following the last dose of cyclophosphamide.

Enhanced bioactivation of cyclophosphamide may increase the risk of cardiotoxicity. A 30-minute infusion of thiotepa administered 1 hour before a 60-minute infusion of cyclophosphamide reduced bioactivation of cyclophosphamide to 4-hydroxycyclophosphamide in 20 patients. This effect did not occur with administration of thiotepa 1 hour following infusion of cyclophosphamide. Intravascular red blood cell hemolysis requiring transfusion support occurred during continuous flow plasmapheresis performed 12 hours following infusion of cyclophosphamide 60 mg/kg.

Index TermsCPM; CTX; CYT; Neosar; NSC-26271

CycloSERINE

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

CycloSERINE may be confused with cyclobenzaprine, cycloSPORINE

Pronunciation(sye kloe SER een)

U.S. Brand NamesSeromycin®

Pharmacologic CategoryAntibiotic, Miscellaneous; Antitubercular Agent

Use: Labeled IndicationsAdjunctive treatment in pulmonary or extrapulmonary tuberculosis

Use: Unlabeled/InvestigationalTreatment of Gaucher's disease

Dosing: Adults**Note:** Some of the neurotoxic effects may be relieved or prevented by the concomitant administration of pyridoxine.

Tuberculosis: Oral: Initial: 250 mg every 12 hours for 14 days, then give 500 mg to 1 g/day in 2 divided doses for 18-24 months (maximum daily dose: 1 g)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Some of the neurotoxic effects may be relieved or prevented by the concomitant administration of pyridoxine.

Tuberculosis: Oral: Children: 10-20 mg/kg/day in 2 divided doses up to 1000 mg/day for 18-24 months

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 12-24 hours.

Cl_{cr} <10 mL/minute: Administer every 24 hours.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Dietary ConsiderationsMay be taken with food; may increase vitamin B_{12} and folic acid dietary requirements.

ContraindicationsHypersensitivity to cycloserine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Has been associated with CNS toxicity, including seizures, psychosis, depression, and confusion; decrease dosage or discontinue use if occurs.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Alcoholism: Use with caution in patients with a history of chronic alcoholism; increased risk of seizures.

- Mental illness: Use with caution in patients with depression, severe anxiety, and/or psychosis.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Special populations:

- Patients with potential for folate deficiency: Use with caution in patients with potential folate deficiency (malnourished, chronic anticonvulsant therapy, or elderly).

Geriatric ConsiderationsAdjust dose for renal function.

Pregnancy Risk FactorC

LactationEnters breast milk/compatible

Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiac arrhythmia

Central nervous system: Drowsiness, headache, dizziness, vertigo, seizure, confusion, psychosis, paresis, coma

Dermatologic: Rash

Endocrine & metabolic: Vitamin B_{12} deficiency

Hematologic: Folate deficiency

Hepatic: Liver enzymes increased

Neuromuscular & skeletal: Tremor

Drug Interactions

Isoniazid: CycloSERINE may enhance the CNS depressant effect of Isoniazid. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: May increase vitamin B_{12} and folic acid dietary requirements.

Monitoring ParametersPeriodic renal, hepatic, hematological tests, and plasma cycloserine concentrations

Reference RangeToxicity is greatly increased at levels >30 mcg/mL

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, CNS changes, arrhythmias, vitamin B_{12} deficiency, folate deficiency) regularly during therapy. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsPeriodic renal, hepatic, hematological tests, plasma cycloserine concentrations

Patient EducationTake as prescribed; do not discontinue this medication without consulting prescriber. Avoid alcohol. Maintain recommended diet and adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause drowsiness or restlessness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report skin rash, acute headache, tremors or changes in mentation (confusion, nightmares, depression, or suicide ideation), or fluid retention (respiratory difficulty, swelling of extremities, unusual weight gain). **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Seromycin)

250 mg (14): $60.99

Mechanism of ActionInhibits bacterial cell wall synthesis by competing with amino acid (D-alanine) for incorporation into the bacterial cell wall; bacteriostatic or bactericidal

Pharmacodynamics/Kinetics

Absorption: ~70% to 90%

Distribution: Widely to most body fluids and tissues including CSF, breast milk, bile, sputum, lymph tissue, lungs, and ascitic, pleural, and synovial fluids; crosses placenta

Half-life elimination: Normal renal function: 10 hours

Metabolism: Hepatic

Time to peak, serum: 3-4 hours

Excretion: Urine (60% to 70% as unchanged drug) within 72 hours; feces (small amounts); remainder metabolized

Related Information

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

CycloSPORINE may be confused with cyclophosphamide, Cyklokapron®, cycloSERINE

CycloSPORINE modified (Neoral®, Gengraf®) may be confused with cycloSPORINE non-modified (Sandimmne®)

Gengraf® may be confused with Prograf®

Neoral® may be confused with Neurontin®, Nizoral®

Sandimmune® may be confused with Sandostatin®

Pronunciation(SYE kloe spor een)

U.S. Brand NamesGengraf®; Neoral®; Restasis®; Sandimmune®

Canadian Brand NamesNeoral®; Rhoxal-cyclosporine; Sandimmune® I.V.; Sandoz-Cyclosporine

Pharmacologic CategoryImmunosuppressant Agent

Use: Labeled IndicationsProphylaxis of organ rejection in kidney, liver, and heart transplants, has been used with azathioprine and/or corticosteroids; severe, active rheumatoid arthritis (RA) not responsive to methotrexate alone; severe, recalcitrant plaque psoriasis in nonimmunocompromised adults unresponsive to or unable to tolerate other systemic therapy

Ophthalmic emulsion (Restasis®): Increase tear production when suppressed tear production is presumed to be due to keratoconjunctivitis sicca-associated ocular inflammation (in patients not already using topical anti-inflammatory drugs or punctal plugs)

Use: Unlabeled/InvestigationalShort-term, high-dose cyclosporine as a modulator of multidrug resistance in cancer treatment; allogenic bone marrow transplants for prevention and treatment of graft-versus-host disease; also used in some cases of severe autoimmune disease (eg, SLE, myasthenia gravis, inflammatory bowel disease) that are resistant to corticosteroids and other therapy; focal segmental glomerulosclerosis

Use: DentalUsed as an immunosuppressive agent

Dosing: Adults**Neoral®/Genraf® and Sandimmune® are not bioequivalent and cannot be used interchangeably.**

Newly-transplanted patients: Adjunct therapy with corticosteroids is recommended. Initial dose should be given 4-12 hours prior to transplant or may be given postoperatively; adjust initial dose to achieve desired plasma concentration.

Oral: Dose is dependent upon type of transplant and formulation:

Cyclosporine (modified):

Renal: 9 ± 3 mg/kg/day, divided twice daily

Liver: 8 ± 4 mg/kg/day, divided twice daily

Heart: 7 ± 3 mg/kg/day, divided twice daily

Cyclosporine (non-modified): Initial dose: 15 mg/kg/day as a single dose (range 14-18 mg/kg); lower doses of 10-14 mg/kg/day have been used for renal transplants. Continue initial dose daily for 1-2 weeks; taper by 5% per week to a maintenance dose of 5-10 mg/kg/day; some renal transplant patients may be dosed as low as 3 mg/kg/day

Note: When using the non-modified formulation, cyclosporine levels may increase in liver transplant patients when the T-tube is closed; dose may need decreased

I.V.: Manufacturer's labeling: Cyclosporine (non-modified): Initial dose: 5-6 mg/kg/day as a single dose ($^1/_3$ the oral dose), infused over 2-6 hours; use should be limited to patients unable to take capsules or oral solution; patients should be switched to an oral dosage form as soon as possible

Note: Many transplant centers administer cyclosporine as "divided dose" infusions (in 2-3 doses/day) or as a continuous (24-hour) infusion; dosages range from 3-7.5 mg/kg/day. Specific institutional protocols should be consulted.

Note: Conversion to cyclosporine (modified) from cyclosporine (non-modified): Start with daily dose previously used and adjust to obtain preconversion cyclosporine trough concentration. Plasma concentrations should be monitored every 4-7 days and dose adjusted as necessary, until desired trough level is obtained. When transferring patients with previously poor absorption of cyclosporine (non-modified), monitor trough levels at least twice weekly (especially if initial dose exceeds 10 mg/kg/day); high plasma levels are likely to occur.

Rheumatoid arthritis: Oral: Cyclosporine (modified): Initial dose: 2.5 mg/kg/day, divided twice daily; salicylates, NSAIDs, and oral glucocorticoids may be continued (refer to Drug Interactions); dose may be increased by 0.5-0.75 mg/kg/day if insufficient response is seen after 8 weeks of treatment; additional dosage increases may be made again at 12 weeks (maximum dose: 4 mg/kg/day). Discontinue if no benefit is seen by 16 weeks of therapy.

Note: Increase the frequency of blood pressure monitoring after each alteration in dosage of cyclosporine. Cyclosporine dosage should be decreased by 25% to 50% in patients with no history of hypertension who develop sustained hypertension during therapy and, if hypertension persists, treatment with cyclosporine should be discontinued.

Psoriasis: Oral: Cyclosporine (modified): Initial dose: 2.5 mg/kg/day, divided twice daily; dose may be increased by 0.5 mg/kg/day if insufficient response is seen after 4 weeks of treatment; additional dosage increases may be made every 2 weeks if needed (maximum dose: 4 mg/kg/day). Discontinue if no benefit is seen by 6 weeks of therapy. Once patients are adequately controlled, the dose should be decreased to the lowest effective dose. Doses <2.5 mg/kg/day may be effective. Treatment longer than 1 year is not recommended.

Note: Increase the frequency of blood pressure monitoring after each alteration in dosage of cyclosporine. Cyclosporine dosage should be decreased by 25% to 50% in patients with no history of hypertension who develop sustained hypertension during therapy and, if hypertension persists, treatment with cyclosporine should be discontinued.

Focal segmental glomerulosclerosis (unlabeled use): Initial: 3 mg/kg/day divided every 12 hours

Autoimmune diseases (unlabeled use): 1-3 mg/kg/day

Keratoconjunctivitis sicca: Ophthalmic: (Restasis®): Instill 1 drop in each eye every 12 hours

Dosing: ElderlyRefer to adult dosing. **Sandimmune® and Neoral®/Genraf® are not bioequivalent and cannot be used interchangeably.**

Dosing: PediatricTransplant: Refer to adult dosing; children may require, and are able to tolerate, larger doses than adults.

Dosing: Renal ImpairmentFor severe psoriasis:

Serum creatinine levels ≥25% above pretreatment levels: Take another sample within 2 weeks; if the level remains ≥25% above pretreatment levels, decrease dosage of cyclosporine (modified) by 25% to 50%. If two dosage adjustments do not reverse the increase in serum creatinine levels, treatment should be discontinued.

Serum creatinine levels ≥50% above pretreatment levels: Decrease cyclosporine dosage by 25% to 50%. If two dosage adjustments do not reverse the increase in serum creatinine levels, treatment should be discontinued.

Hemodialysis: Supplemental dose is not necessary.

Peritoneal dialysis: Supplemental dose is not necessary.

Dosing: Hepatic ImpairmentDosage adjustment is probably necessary; monitor levels closely

Administration: I.V.The manufacturer recommends that following dilution, intravenous admixture be administered over 2-6 hours. However, many transplant centers administer as divided doses (2-3 doses/day) or as a 24-hour continuous infusion. Patients should be under continuous observation for at least the first 30 minutes of the infusion, and should be monitored frequently thereafter.

Administration: I.V. DetailAnaphylaxis has been reported with I.V. use; reserve for patients who cannot take oral form. Patients should be under continuous observation for at least the first 30 minutes of the infusion, and should be monitored frequently thereafter. Maintain patent airway; other supportive measures and agents for treating anaphylaxis should be present when I.V. drug is given. Discard solution after 24 hours.

Administration: OralOral solution: Do not administer liquid from plastic or styrofoam cup. May dilute Neoral® oral solution with orange juice or apple juice. May dilute Sandimmune® oral solution with milk, chocolate milk, or orange juice. Avoid changing diluents frequently. Mix thoroughly and drink at once. Use syringe provided to measure dose. Mix in a glass container and rinse container with more diluent to ensure total dose is taken. Do not rinse syringe before or after use (may cause dose variation).

Administration: OtherOphthalmic emulsion: Prior to use, invert vial several times to obtain a uniform emulsion. Remove contact lenses prior to instillation of drops; may be reinserted 15 minutes after administration. May be used with artificial tears; allow 15 minute interval between products.

Dietary ConsiderationsAdminister this medication consistently with relation to time of day and meals. Avoid grapefruit juice.

Storage

Capsule: Store at controlled room temperature.

Injection: Store at controlled room temperature; do not refrigerate. Ampuls should be protected from light. Stability of injection of parenteral admixture at room temperature (25°C) is 6 hours in PVC; 24 hours in Excel®, PAB® containers, or glass.

Ophthalmic emulsion: Store at 15°C to 25°C (59°F to 77°F). Vials are single-use; discard immediately following administration.

Oral solution: Store at controlled room temperature; do not refrigerate. Use within 2 months after opening; should be mixed in glass containers.

Reconstitution**Sandimmune® injection:** Injection should be further diluted [1 mL (50 mg) of concentrate in 20-100 mL of D_5W or NS] for administration by intravenous infusion.

CompatibilityStable in D_5W, fat emulsion 10%, fat emulsion 20%, NS.

Y-site administration: Compatible: Alatrofloxacin, gatifloxacin, linezolid, propofol, sargramostim. **Incompatible:** Amphotericin B cholesteryl sulfate complex.

Compatibility when admixed: Compatible: Ciprofloxacin. **Incompatible:** Magnesium sulfate.

ContraindicationsHypersensitivity to cyclosporine or any component of the formulation. Rheumatoid arthritis and psoriasis: Abnormal renal function, uncontrolled hypertension, malignancies. Concomitant treatment with PUVA or UVB therapy, methotrexate, other immunosuppressive agents, coal tar, or radiation therapy are also contraindications for use in patients with psoriasis. Ophthalmic emulsion is contraindicated in patients with active ocular infections.

Allergy Considerations

- CycloSPORINE Allergy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Hypertension: See “Concerns related to adverse effects” below.
- Infection: See “Concerns related to adverse effects” below.
- Malignancy: See “Concerns related to adverse effects” below.
- Nephrotoxicity: “Concerns related to adverse effects” below.
- Non-interchangeability of modified/non-modified forms: See “Dosage form specific issues” below.
- Skin cancer: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hepatotoxicity: Increased hepatic enzymes and bilirubin have occurred (when used at high doses); improvement usually seen with dosage reduction.
- Hypertension: **[U.S. Boxed Warning]: May cause hypertension.**
- Infection: **[U.S. Boxed Warning]: Increased risk of infection with use; fatal infections have been reported.**
- Malignancy: **[U.S. Boxed Warning]: Increased risk of lymphomas and other malignancies with use, particulary those of the skin;** risk is related to intensity/duration of therapy and the use of more than one immunosuppressive agent; all patients should avoid excessive sun/UV light exposure.
- Nephrotoxicity: **[U.S. Boxed Warning]: Renal impairment, including structural kidney damage has occurred (when used at high doses); monitor renal function closely.** Use caution with other potentially nephrotoxic drugs (eg, acyclovir, aminoglycoside antibiotics, amphotericin B, ciprofloxacin).
- Skin cancer: **[U.S. Boxed Warning]: Risk of skin cancer may be increased in psoriasis patients with a history of PUVA and possibly methotrexate or other immunosuppressants, UVB, coal tar, or radiation;** increased risk of skin cancer has also been established in transplant patients; risk is related to intensity/duration of therapy and the use of more than one immunosuppressive agent; all patients should avoid excessive sun/UV light exposure.

Disease-related concerns:

- Rheumatoid arthritis: Appropriate use: If receiving other immunosuppressive agents, radiation or UV therapy, concurrent use of cyclosporine is not recommended.

Special populations:

- Pediatrics: Safety and efficacy for use in psoriasis have not been established in children. Safety and efficacy of the ophthalmic emulsion have not been established in children <16 years of age. Safety and efficacy for use in juvenile rheumatoid arthritis have not been established.
- Transplant patients: To be used initially with corticosteroids. May cause significant hyperkalemia and hyperuricemia. May cause seizures, particularly if used with high-dose corticosteroids. Encephalopathy has been reported, predisposing factors include hypertension, hypomagnesemia, hypocholesterolemia, high-dose corticosteroids, high cyclosporine serum concentration, and graft-versus-host disease; may be more common in patients with liver transplant. Make dose adjustments based on cyclosporine blood concentrations. Anaphylaxis has been reported with I.V. use; reserve for patients who cannot take oral form.

Dosage form specific issues:

- Corn oil: Product may contain corn oil.
- Ethanol: Products may contain ethanol.
- Injection: Contains Cremophor® EL (polyoxyethylated castor oil), which has been associated with rare anaphylactic reactions.
- Non-interchangeability of modified/non-modified forms: Use caution when changing dosage forms; products are not equally interchangeable. Cyclosporine (modified) refers to the capsule dosage formulation of cyclosporine in an aqueous dispersion (previously referred to as “microemulsion”). **[U.S. Boxed Warning]: Cyclosporine (modified) has increased bioavailability as compared to cyclosporine (non-modified) and cannot be used interchangeably without close monitoring.**
- Propylene glycol: Products may contain propylene glycol.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Adjustment of dose should only be made under the direct supervision of an experienced physician.**
- Monitoring of concentrations: Monitor cyclosporine concentrations closely following the addition, modification, or deletion of other medications.

- Vaccines: Live, attenuated vaccines may be less effective; use should be avoided.

Geriatric ConsiderationsCyclosporine has not been specifically studied in the elderly. Cyclosporine is being used in combination therapy for the treatment of severe rheumatoid arthritis.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproductive toxicity has been observed in animal studies; mutagenic and teratogenic effects were not observed in the standard test systems following oral administration. In humans, cyclosporine crosses the placenta. Based on clinical use, premature births and low birth weight were consistently observed. Use only if the benefit to the mother outweighs the possible risks to the fetus.

A pregnancy registry has been established for pregnant women taking immunosuppressants following any solid organ transplant (National Transplantation Pregnancy Registry, Temple University, 877-955-6877).

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsThe AAP does not recommend breast-feeding during therapy due to possible immune suppression in the infant as well as the unknown effects on growth or association with carcinogenesis.

Adverse ReactionsAdverse reactions reported with systemic use, including rheumatoid arthritis, psoriasis, and transplantation (kidney, liver, and heart). Percentages noted include the highest frequency regardless of indication/dosage. Frequencies may vary for specific conditions or formulation.

>10%:

Cardiovascular: Hypertension (8% to 53%), edema (5% to 14%)

Central nervous system: Headache (2% to 25%)

Dermatologic: Hirsutism (21% to 45%), hypertrichosis (5% to 19%)

Endocrine & metabolic: Triglycerides increased (15%), female reproductive disorder (9% to 11%)

Gastrointestinal: Nausea (23%), diarrhea (3% to 13%), gum hyperplasia (2% to 16%), abdominal discomfort (<1% to 15%), dyspepsia (2% to 12%)

Neuromuscular & skeletal: Tremor (7% to 55%), paresthesia (1% to 11%), leg cramps/muscle contractions (2% to 12%)

Renal: Renal dysfunction/nephropathy (10% to 38%), creatinine increased (16% to ≥50%)

Respiratory: Upper respiratory infection (1% to 14%)

Miscellaneous: Infection (3% to 25%)

Kidney, liver, and heart transplant only (≤2% unless otherwise noted):

Cardiovascular: Flushes (<1% to 4%), MI

Central nervous system: Convulsions (1% to 5%), anxiety, confusion, fever, lethargy

Dermatologic: Acne (1% to 6%), brittle fingernails, hair breaking, pruritus

Endocrine & metabolic: Gynecomastia (<1% to 4%), hyperglycemia

Gastrointestinal: Nausea (2% to 10%), vomiting (2% to 10%), diarrhea (3% to 8%), abdominal discomfort (<1% to 7%), cramps (0% to 4%), anorexia, constipation, gastritis, mouth sores, pancreatitis, swallowing difficulty, upper GI bleed, weight loss

Hematologic: Leukopenia (<1% to 6%), anemia, thrombocytopenia

Hepatic: Hepatotoxicity (<1% to 7%)

Neuromuscular & skeletal: Paresthesia (1% to 3%), joint pain, muscle pain, tingling, weakness

Ocular: Conjunctivitis, visual disturbance

Otic: Hearing loss, tinnitus

Renal: Hematuria

Respiratory: Sinusitis (<1% to 7%)

Miscellaneous: Lymphoma (<1% to 6%), allergic reactions, hiccups, night sweats

Rheumatoid arthritis only (1% to <3% unless otherwise noted):

Cardiovascular: Hypertension (8%), edema (5%), chest pain (4%), arrhythmia (2%), abnormal heart sounds, cardiac failure, MI, peripheral ischemia

Central nervous system: Dizziness (8%), pain (6%), insomnia (4%), depression (3%), migraine (2%), anxiety, hypoesthesia, emotional lability, impaired concentration, malaise, nervousness, paranoia, somnolence, vertigo

Dermatologic: Purpura (3%), abnormal pigmentation, angioedema, cellulitis, dermatitis, dry skin, eczema, folliculitis, nail disorder, pruritus, skin disorder, urticaria

Endocrine & metabolic: Menstrual disorder (3%), breast fibroadenosis, breast pain, diabetes mellitus, goiter, hot flashes, hyperkalemia, hyperuricemia, hypoglycemia, libido increased/decreased

Gastrointestinal: Vomiting (9%), flatulence (5%), gingivitis (4%), gum hyperplasia (2%), constipation, dry mouth, dysphagia, enanthema, eructation, esophagitis, gastric ulcer, gastritis, gastroenteritis, gingival bleeding, glossitis, peptic ulcer, salivary gland enlargement, taste perversion, tongue disorder, tooth disorder, weight loss/gain

Genitourinary: Leukorrhea (1%), abnormal urine, micturition urgency, nocturia, polyuria, pyelonephritis, urinary incontinence, uterine hemorrhage

Hematologic: Anemia, leukopenia

Hepatic: Bilirubinemia

Neuromuscular & skeletal: Paresthesia (8%), tremor (8%), leg cramps/muscle contractions (2%), arthralgia, bone fracture, joint dislocation, myalgia, neuropathy, stiffness, synovial cyst, tendon disorder, weakness

Ocular: Abnormal vision, cataract, conjunctivitis, eye pain

Otic: Tinnitus, deafness, vestibular disorder

Renal: BUN increased, hematuria, renal abscess

Respiratory: Cough (5%), dyspnea (5%), sinusitis (4%), abnormal chest sounds, bronchospasm, epistaxis

Miscellaneous: Infection (9%), abscess, allergy, bacterial infection, carcinoma, fungal infection, herpes simplex, herpes zoster, lymphadenopathy, moniliasis, diaphoresis increased, tonsillitis, viral infection

Psoriasis only (1% to <3% unless otherwise noted):

Cardiovascular: Chest pain, flushes

Central nervous system: Psychiatric events (4% to 5%), pain (3% to 4%), dizziness, fever, insomnia, nervousness, vertigo

Dermatologic: Hypertrichosis (5% to 7%), acne, dry skin, folliculitis, keratosis, pruritus, rash, skin malignancies

Endocrine & metabolic: Hot flashes

Gastrointestinal: Nausea (5% to 6%), diarrhea (5% to 6%), gum hyperplasia (4% to 6%), abdominal discomfort (3% to 6%), dyspepsia (2% to 3%), abdominal distention, appetite increased, constipation, gingival bleeding

Genitourinary: Micturition increased

Hematologic: Bleeding disorder, clotting disorder, platelet disorder, red blood cell disorder

Hepatic: Hyperbilirubinemia

Neuromuscular & skeletal: Paresthesia (5% to 7%), arthralgia (1% to 6%)

Ocular: Abnormal vision

Respiratory: Bronchospasm (5%), cough (5%), dyspnea (5%), rhinitis (5%), respiratory infection

Miscellaneous: Flu-like syndrome (8% to 10%)

Postmarketing and/or case reports (any indication): Anaphylaxis/anaphylactoid reaction (possibly associated with Cremophor® EL vehicle in injection formulation), benign intracranial hypertension, cholesterol increased, death (due to renal deterioration), encephalopathy, gout, hyperbilirubinemia, hyperkalemia, hypomagnesemia (mild), impaired consciousness, neurotoxicity, papilloedema, pulmonary edema (noncardiogenic), uric acid increased

Ophthalmic emulsion (Restasis®):

>10%: Ocular: Burning (17%)

1% to 10%: Ocular: Hyperemia (conjunctival 5%), eye pain, pruritus, stinging

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2C9 (weak), 3A4 (moderate)
Drug Interactions

ACE Inhibitors: May enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Aliskiren: CycloSPORINE may increase the serum concentration of Aliskiren. *Risk X: Avoid combination*

Ambrisentan: CycloSPORINE may increase the serum concentration of Ambrisentan. *Risk C: Monitor therapy*

Aminoglycosides: May enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Amiodarone: May decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Amphotericin B: May enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Androgens: May enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D:*

Consider therapy modification

Antacids: May decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Bosentan: CycloSPORINE may increase the serum concentration of Bosentan. Bosentan may decrease the serum concentration of CycloSPORINE. *Risk X: Avoid combination*

Bromocriptine: May increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Calcium Channel Blockers (Dihydropyridine): CycloSPORINE may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. **Exceptions:** Clevidipine. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of CycloSPORINE. CycloSPORINE may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Cardiac Glycosides: CycloSPORINE may decrease the metabolism of Cardiac Glycosides. *Risk D: Consider therapy modification*

Carvedilol: May increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Caspofungin: CycloSPORINE may enhance the adverse/toxic effect of Caspofungin. Significant increases in alanine transaminase have been reported. *Risk D: Consider therapy modification*

Colchicine: CycloSPORINE may enhance the adverse/toxic effect of Colchicine. These include hepatotoxicity and myopathies. Colchicine may increase the serum concentration of CycloSPORINE. Nephrotoxicity and hepatotoxicity may also be increased. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): May increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

DOXOrubicin: CycloSPORINE may decrease the metabolism of DOXOrubicin. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Etoposide: CycloSPORINE may decrease the metabolism of Etoposide. *Risk D: Consider therapy modification*

Etoposide Phosphate: CycloSPORINE may increase the serum concentration of Etoposide Phosphate. CycloSPORINE may decrease the metabolism, via CYP isoenzymes, and decrease the p-glycoprotein-mediated elimination of Etoposide Phosphate. *Risk D: Consider therapy modification*

Ezetimibe: CycloSPORINE may increase the serum concentration of Ezetimibe. Ezetimibe may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fluconazole: May decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Griseofulvin: May increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: CycloSPORINE may increase the serum concentration of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of CycloSPORINE. **Exceptions:** Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Melphalan: May enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Methotrexate: May increase the serum concentration of CycloSPORINE. This may result in nephrotoxicity. CycloSPORINE may increase the serum concentration of Methotrexate. This may result in nausea, vomiting, oral ulcers, hepatotoxicity and/or nephrotoxicity. *Risk D: Consider therapy modification*

Metoclopramide: May increase the absorption of CycloSPORINE. *Risk C: Monitor therapy*

MetroNIDAZOLE: May decrease the metabolism of Calcineurin Inhibitors. *Risk C: Monitor therapy*

Minoxidil: CycloSPORINE may enhance the adverse/toxic effect of Minoxidil. Severe hypertrichosis has been reported. *Risk C: Monitor therapy*

Mycophenolate: CycloSPORINE may decrease the serum concentration of Mycophenolate. Specifically, cyclosporine may decrease concentrations of the active metabolite mycophenolic acid. *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Norfloxacin: May decrease the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Probucol: May decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Pyrazinamide: May decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Repaglinide: CycloSPORINE may increase the serum concentration of Repaglinide. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of CycloSPORINE. An increased risk of calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) has been described. CycloSPORINE may increase the serum concentration of Sirolimus. This is of specific concern with cyclosporine [MODIFIED]. *Risk D: Consider therapy modification*

Sitaxsentan: CycloSPORINE may increase the serum concentration of Sitaxsentan. *Risk X: Avoid combination*

Somatostatin Analogs: May decrease the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

St Johns Wort: May increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Sulfinpyrazone [Off Market]: May decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Sulfonamide Derivatives: May enhance the nephrotoxic effect of CycloSPORINE. Sulfonamide Derivatives may decrease the serum concentration of CycloSPORINE. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Sulfonylureas: May increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of CycloSPORINE. An increased risk of calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) has been described with concomitant sirolimus use. *Risk D: Consider therapy modification*

Terbinafine: May decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Grapefruit juice increases cyclosporine absorption

Herb/Nutraceutical: Avoid St John's wort; as an enzyme inducer, it may increase the metabolism of and decrease plasma levels of cyclosporine; organ rejection and graft loss have been reported. Avoid cat's claw, echinacea (have immunostimulant properties).

Test InteractionsSpecific whole blood, HPLC assay for cyclosporine may be falsely elevated if sample is drawn from the same line through which dose was administered (even if flush has been administered and/or dose was given hours before).

Monitoring ParametersMonitor blood pressure and serum creatinine after any cyclosporine dosage changes or addition, modification, or deletion of other medications. Monitor plasma concentrations periodically.

Transplant patients: Cyclosporine trough levels, serum electrolytes, renal function, hepatic function, blood pressure, lipid profile

Psoriasis therapy: Baseline blood pressure, serum creatinine (2 levels each), BUN, CBC, serum magnesium, potassium, uric acid, lipid profile. Biweekly monitoring of blood pressure, complete blood count, and levels of BUN, uric acid, potassium, lipids, and magnesium during the first 3 months of treatment for psoriasis. Monthly monitoring is recommended after this initial period. Also evaluate any atypical skin lesions prior to therapy. Increase the frequency of blood pressure monitoring after each alteration in dosage of cyclosporine. Cyclosporine dosage should be decreased by 25% to 50% in patients with no history of hypertension who develop sustained hypertension during therapy and, if hypertension persists, treatment with cyclosporine should be discontinued.

Rheumatoid arthritis: Baseline blood pressure, and serum creatinine (2 levels each); serum creatinine every 2 weeks for first 3 months, then monthly if patient is stable. Increase the frequency of blood pressure monitoring after each alteration in dosage of cyclosporine. Cyclosporine dosage should be decreased by 25% to 50% in patients with no history of hypertension who develop sustained hypertension during therapy and, if hypertension persists, treatment with cyclosporine should be discontinued.

Reference RangeReference ranges are method dependent and specimen dependent; use the same analytical method consistently

Method-dependent and specimen-dependent: Trough levels should be obtained:

Oral: 12-18 hours after dose (chronic usage)

I.V.: 12 hours after dose **or** immediately prior to next dose

Therapeutic range: Not absolutely defined, dependent on organ transplanted, time after transplant, organ function and CsA toxicity:

General range of 100-400 ng/mL

Toxic level: Not well defined, nephrotoxicity may occur at any level

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor kidney and hepatic function closely. Monitor blood pressure and assess for signs of fluid retention periodically. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically throughout therapy. Teach patient appropriate administration, possible side effects, and symptoms to report. **I.V.:** Monitor closely for first 30 minutes of infusion and frequently thereafter to assess for adverse reactions.

Monitoring: Lab TestsCyclosporine levels, serum electrolytes, renal function, hepatic function

Patient Education**Oral:** Take dose at the same time each day. You will be susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). Avoid excessive exposure to sun. Practice good oral hygiene to reduce gum inflammation; see a dentist regularly during treatment. Report severe headache; unusual hair growth or deepening of voice; mouth sores or swollen gums; signs of infection; persistent nausea, vomiting, or abdominal pain; muscle pain or cramping; tremors; unusual swelling of extremities, weight gain, or change in urination; difficulty breathing; or chest pain or rapid heartbeat. Increase in blood pressure or damage to the kidney is possible. Your prescriber will need to monitor you closely. Do not change one brand of cyclosporine for another; any changes must be done by your prescriber. If you are taking this medication for psoriasis, your risk of cancer may be increased when taking additional medications. **Oral solution:** Diluting oral solution improves flavor. Dilute Neoral® with orange juice or apple juice. Dilute Sandimmune® with milk, chocolate milk, or orange juice. Avoid changing what you mix with your cyclosporine. Mix thoroughly and drink at once. Use syringe provided to measure dose. Mix in a glass container (do not use plastic or styrofoam) and rinse container with more juice/milk to ensure total dose is taken. Do not rinse syringe before or after use (may cause dose variation). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule [modified]:

Gengraf®: 25 mg [contains alcohol 12.8%]; 100 mg [contains alcohol 12.8%]

Capsule [non-modified]: 25 mg, 100 mg

Capsule, soft gel [modified]: 25 mg, 50 mg, 100 mg

Neoral®: 25 mg [contains alcohol 11.9% and corn oil]; 100 mg [contains alcohol 11.9% and corn oil]

Capsule, soft gel [non-modified]:

Sandimmune®: 25 mg [contains alcohol 12.7% and corn oil]; 100 mg [contains alcohol 12.7% and corn oil]

Emulsion, ophthalmic [preservative free]:

Restasis®: 0.05% (0.4 mL) [contains 30 single-use vials/box]

Injection, solution [non-modified]: 50 mg/mL (5 mL)

Sandimmune®: 50 mg/mL (5 mL) [contains Cremophor® EL (polyoxyethylated castor oil) and alcohol 32.9%]

Solution, oral [modified]: 100 mg/mL (50 mL)

Gengraf®: 100 mg/mL (50 mL) [contains propylene glycol]

Neoral®: 100 mg/mL (50 mL) [contains alcohol 11.9%, corn oil, and propylene glycol]

Solution, oral [non-modified]: 100 mg/mL (50 mL)

Sandimmune®: 100 mg/mL (50 mL) [contains alcohol 12.5%]

Generic AvailableYes: Excludes ophthalmic emulsion

Pricing: U.S. (www.drugstore.com)

Capsules (CycloSPORINE)

25 mg (60): $84.99

100 mg (60): $299.98

Capsules (CycloSPORINE Modified)

25 mg (30): $34.30

100 mg (30): $141.00

Capsules (Gengraf)

25 mg (60): $85.99

100 mg (60): $319.87

Capsules (Neoral)

25 mg (60): $85.99

100 mg (90): $478.18

Capsules (Sandimmune)

25 mg (60): $121.24

100 mg (60): $452.28

Emulsion (Restasis)

0.05% (32): $111.28

Solution (CycloSPORINE Modified)

100 mg/mL (50): $239.99

Solution (Neoral)

100 mg/mL (50): $301.71

Solution (Sandimmune)

50 mg/mL (5): $38.99

100 mg/mL (50): $384.97

Mechanism of ActionInhibition of production and release of interleukin II and inhibits interleukin II-induced activation of resting T-lymphocytes.

Pharmacodynamics/Kinetics

Absorption:

Ophthalmic emulsion: Serum concentrations not detectable.

Oral:

Cyclosporine (non-modified): Erratic and incomplete; dependent on presence of food, bile acids, and GI motility; larger oral doses are needed in pediatrics due to shorter bowel length and limited intestinal absorption

Cyclosporine (modified): Erratic and incomplete; increased absorption, up to 30% when compared to cyclosporine (non-modified); less dependent on food, bile acids, or GI motility when compared to cyclosporine (non-modified)

Distribution: Widely in tissues and body fluids including the liver, pancreas, and lungs; crosses placenta; enters breast milk

V_{dss}: 4-6 L/kg in renal, liver, and marrow transplant recipients (slightly lower values in cardiac transplant patients; children <10 years have higher values)

Protein binding: 90% to 98% to lipoproteins

Metabolism: Extensively hepatic via CYP3A4; forms at least 25 metabolites; extensive first-pass effect following oral administration

Bioavailability: Oral:

Cyclosporine (non-modified): Dependent on patient population and transplant type (<10% in adult liver transplant patients and as high as 89% in renal transplant patients); bioavailability of Sandimmune® capsules and oral solution are equivalent; bioavailability of oral solution is ~30% of the I.V. solution

Children: 28% (range: 17% to 42%); gut dysfunction common in BMT patients and oral bioavailability is further reduced

Cyclosporine (modified): Bioavailability of Neoral® capsules and oral solution are equivalent:

Children: 43% (range: 30% to 68%)

Adults: 23% greater than with cyclosporine (non-modified) in renal transplant patients; 50% greater in liver transplant patients

Half-life elimination: Oral: May be prolonged in patients with hepatic impairment and shorter in pediatric patients due to the higher metabolism rate

Cyclosporine (non-modified): Biphasic: Alpha: 1.4 hours; Terminal: 19 hours (range: 10-27 hours)

Cyclosporine (modified): Biphasic: Terminal: 8.4 hours (range: 5-18 hours)

Time to peak, serum: Oral:

Cyclosporine (non-modified): 2-6 hours; some patients have a second peak at 5-6 hours

Cyclosporine (modified): Renal transplant: 1.5-2 hours

Excretion: Primarily feces; urine (6%, 0.1% as unchanged drug and metabolites)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsCyclosporine (modified): Refers to the capsule dosage formulation of cyclosporine in an aqueous dispersion (previously referred to as “microemulsion”). Cyclosporine (modified) has increased bioavailability as compared to cyclosporine (non-modified) and cannot be used interchangeably without close monitoring.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mouth sores, swallowing difficulty, gingivitis, gum hyperplasia, xerostomia (normal salivary flow resumes upon discontinuation), abnormal taste, tongue disorder, tooth disorder, and gingival bleeding.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentCarbamazepine and phenobarbital may increase the clearance of cyclosporine resulting in decreased levels; nefazodone may inhibit the clearance of cyclosporine resulting in increased levels of cyclosporine. There have been reports of serious drug interactions between cyclosporine and St John's wort. This interaction produces a reduction in serum cyclosporine levels resulting in subtherapeutic levels, rejection of transplanted organs, and graft loss.

Cardiovascular ConsiderationsCyclosporine is widely used in the cardiovascular setting, particularly in patients with cardiac transplantation. In these patients, an important consequence of cyclosporine use is hypertension. Because of widespread drug interactions, the concomitant use of other drugs and the addition of new drugs should be carefully evaluated to ensure that these do not influence the concentrations of cyclosporine.

Index TermsCsA; CyA; Cyclosporin A

Medication Safety Issues

Sound-alike/look-alike issues:

Cyproheptadine may be confused with cyclobenzaprine

Periactin may be confused with Perative®, Percodan®, Persantine®

Pronunciation(si proe HEP ta deen)

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsPerennial and seasonal allergic rhinitis and other allergic symptoms including urticaria

Use: Unlabeled/InvestigationalAppetite stimulation, blepharospasm, cluster headaches, migraine headaches, Nelson's syndrome, pruritus, schizophrenia, spinal cord damage associated spasticity, and tardive dyskinesia

Dosing: Adults

Appetite stimulation (including anorexia nervosa): Oral: 2 mg 4 times/day; may be increased gradually over a 3-week period to 8 mg 4 times/day

Allergic conditions: Oral: 4-20 mg/day divided every 8 hours (not to exceed 0.5 mg/kg/day)

Cluster headaches: Oral: 4 mg 4 times/day

Migraine headaches: Oral: 4-8 mg 3 times/day

Spasticity associated with spinal cord damage: Oral: 4 mg at bedtime; increase by a 4 mg dose every 3-4 days; average daily dose: 16 mg in divided doses; not to exceed 36 mg/day

Dosing: ElderlyOral: Initial: 4 mg twice daily

Dosing: Pediatric

Allergic conditions: Oral: Children: 0.25 mg/kg/day or 8 mg/m^2/day in 2-3 divided doses **or**

2-6 years: 2 mg every 8-12 hours (not to exceed 12 mg/day)

7-14 years: 4 mg every 8-12 hours (not to exceed 16 mg/day)

Migraine headaches: 4 mg 2-3 times/day

Spasticity associated with spinal cord damage: Oral: Children ≥12 years: Refer to adult dosing.

Appetite stimulation (Including anorexia nervosa): Children >13 years: Refer to adult dosing.

Dosing: Hepatic ImpairmentDosage should be reduced in patients with significant hepatic dysfunction.

Calculations

- Body Surface Area: Pediatrics

ContraindicationsHypersensitivity to cyproheptadine or any component of the formulation; narrow-angle glaucoma; bladder neck obstruction; symptomatic prostatic hyperplasia; acute asthmatic attack; stenosing peptic ulcer; GI tract obstruction; concurrent use of MAO inhibitors; avoid use in premature and term newborns due to potential association with SIDS

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Anorexic adults: In case reports, cyproheptadine has promoted weight gain in anorexic adults, though it has not been specifically studied in the elderly. All cases of weight loss or decreased appetite should be adequately assessed.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Antihistamines may cause excitation in young children. Safety and efficacy have not been established in children <2 years of age.

Geriatric ConsiderationsIn case reports, cyproheptadine has promoted weight gain in anorexic adults, though it has not been specifically studied in the elderly. All cases of weight loss or decreased appetite should be adequately assessed. Cyproheptadine may cause less sedation than diphenhydramine or hydroxyzine and, therefore, may be useful for pruritus in elderly; however, elderly may not tolerate anticholinergic effects.
Pregnancy Risk FactorB
LactationExcretion in breast milk unknown/contraindicated
Adverse Reactions

>10%:

Central nervous system: Slight-to-moderate drowsiness

Respiratory: Thickening of bronchial secretions

1% to 10%:

Central nervous system: Dizziness, fatigue, headache, nervousness

Gastrointestinal: Abdominal pain, appetitie stimulation, diarrhea, nausea, xerostomia

Neuromuscular & skeletal: Arthralgia

Respiratory: Pharyngitis

<1%: Allergic reaction, angioedema, bronchospasm, CNS stimulation, depression, edema, epistaxis, hemolytic anemia, hepatitis, leukopenia, myalgia, palpitation, paresthesia, photosensitivity, rash, sedation, seizure, tachycardia, thrombocytopenia

Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Cyproheptadine may diminish the therapeutic effect of Selective Serotonin Reuptake Inhibitors. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS sedation).
Test InteractionsDiagnostic antigen skin test results may be suppressed; false positive serum TCA screen
Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor weight periodically. Monitor effectiveness of therapy and adverse reactions (eg, excess anticholinergic effects) at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationTake as directed; do not exceed recommended dose. Avoid use of other depressants, alcohol, or sleep-inducing medications unless approved by prescriber. You may experience drowsiness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth, nausea, or abdominal pain (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report persistent sedation, confusion, or agitation; changes in urinary pattern; blurred vision; chest pain or palpitations; sore throat respiratory difficulty or expectorating (thick secretions); significant change in weight; or lack of improvement or worsening or condition. **Breast-feeding precaution:** Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup, as hydrochloride: 2 mg/5 mL (473 mL) [contains alcohol 5%; mint flavor]

Tablet, as hydrochloride: 4 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Syrup (Cyproheptadine HCl)

2 mg/5 mL (120): $14.99

Tablets (Cyproheptadine HCl)

4 mg (30): $11.99

Mechanism of ActionA potent antihistamine and serotonin antagonist, competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract

Pharmacodynamics/Kinetics

Absorption: Completely

Metabolism: Almost completely hepatic

Excretion: Urine (>50% primarily as metabolites); feces (~25%)

Pharmacotherapy PearlsMay stimulate appetite. In case reports, cyproheptadine has promoted weight gain in anorexic adults.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause nervousness or depression

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors; concurrent use with psychotropic may produce additive sedation

Anesthesia and Critical Care Concerns/Other ConsiderationsMay stimulate appetite; in case reports, cyproheptadine has promoted weight gain in anorexic adults.

Index TermsCyproheptadine Hydrochloride; Periactin

Cyproterone and Ethinyl Estradiol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(sye PROE ter one & ETH in il es tra DYE ole)

Canadian Brand NamesCyestra-35; Diane-35®

Pharmacologic CategoryAcne Products; Estrogen and Progestin Combination

Use: Labeled IndicationsTreatment of females with severe acne, unresponsive to other therapies, with associated symptoms of androgenization (including mild hirsutism or seborrhea). **Should not be used solely for contraception;** however, will provide reliable contraception if taken as recommended for approved indications.

Dosing: AdultsFemale: Acne: Oral: One tablet daily for 21 days, followed by 7 days off; first cycle should begin on the first day of menstrual flow. Discontinue therapy 3-4 cycles after symptoms have resolved.

Dosing: Renal ImpairmentSpecific guidelines not available; use with caution.

Dosing: Hepatic ImpairmentContraindicated in hepatic impairment or active liver disease.

Administration: OralAdminister at the same time each day.

StorageStore at controlled room temperature of 25°C (77°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to ethinyl estradiol, cyproterone, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, valvular heart disease with complications, severe hypertension; diabetes mellitus with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; hepatic dysfunction or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; ocular lesions resulting from vascular disease; history of otosclerosis with deterioration during pregnancy; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Breast cancer: The use of combination oral contraceptive therapy has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.
- Glucose intolerance: Combination hormonal contraceptives may cause glucose intolerance.
- Lipid effects: Combination hormonal contraceptives may effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Thromboembolism: May increase the risk of thromboembolism; users appear to have an elevated risk relative to users of oral contraceptives in some published studies.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; avoid use in hypertensive women.
- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.
- Gallbladder disease: May have a dose-related risk of gallbladder disease.
- Migraine: Use with caution in patients with a history of migraine.
- Renal impairment: Use with caution in patients with renal disease.

Special populations:

- Smokers: The risk of cardiovascular side effects with oral contraceptives increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination estrogen/progestin therapy should be strongly advised not to smoke.

Other warnings/precautions:

- Contraceptive properties: Should not be prescribed solely for its contraceptive properties (secondary nonhormonal contraception recommended in patients who may not adhere to dosing). Should not be used in combination with other oral contraceptives. This combination shares many of the risks of oral contraceptive agents.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, combination hormonal contraceptives should not be started earlier than 4-6 weeks following delivery.

LactationEnters breast milk/not recommended

Adverse Reactions**Note:** This listing reflects reactions reported with combination hormonal contraceptives. Percentages specific to this combination are identified in parentheses.

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, edema (2%), hypertension, mesenteric thrombosis, MI

Note: The frequency of venous thromboembolism in users of cyproterone and ethinyl estradiol has been estimated to be from 1.2 to 9.9 events per 10,000 women-years. The incidence of these events in nonusers of any oral contraceptive has been estimated to be 0.5 to 1 event per 10,000 women-years, and increases to 4 events per 10,000 women-years for users of low-dose estrogen combinations.

Central nervous system: Headache (5%), depression (3%), dizziness (1%), nervousness (4%), migraine, premenstrual syndrome, stroke

Dermatologic: Chloasma (4%), acne, erythema multiforme, erythema nodosum, hirsutism, loss of scalp hair, melasma (may persist), rash (allergic)

Endocrine & metabolic: Dysmenorrhea (10%), breast tenderness (7%), libido changes (3%), sex hormone-binding globulins (SHBG) increased, amenorrhea, breakthrough bleeding, breast enlargement, breast secretion, carbohydrate intolerance, lactation decreased (postpartum), glucose tolerance decreased, menstrual flow changes, spotting, temporary infertility (following discontinuation), thyroid-binding globulin increased, triglycerides increased

Gastrointestinal: Nausea (2%), abdominal cramps, appetite changes, bloating, cholestasis, colitis, gallbladder disease, jaundice, vomiting, weight gain/loss

Genitourinary: Cervical erosion changes, cervical secretion changes, cystitis-like syndrome, vaginal candidiasis, vaginitis

Hematologic: Antithrombin III decreased, folate levels decreased, hemolytic uremic syndrome, norepinephrine-induced platelet aggregability increased, porphyria, prothrombin increased; factors VII, VIII, IX, and X increased

Hepatic: Benign liver tumors, Budd-Chiari syndrome, cholestatic jaundice, hepatic adenomas

Local: Thrombophlebitis

Ocular: Cataracts, change in corneal curvature (steepening), contact lens intolerance, optic neuritis, retinal thrombosis

Renal: Renal function impaired

Respiratory: Pulmonary thromboembolism

Miscellaneous: Hemorrhagic eruption

Metabolism/Transport EffectsEthinyl estradiol: **Substrate** of CYP2C9 (minor), 3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C8 (weak), 2C19 (weak), 3A4 (weak)

Drug Interactions

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if combination hormonal contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease levels. Herbs with estrogenic properties may enhance the adverse/toxic effect of estrogen derivatives; examples include alfalfa, black cohosh, bloodroot, hops, kudzu, licorice, red clover, saw palmetto, soybean, thyme, wild yam, yucca. Herbs with progestogenic properties may enhance the adverse/toxic effect of progestins; examples include bloodroot, chasteberry, damiana, oregano, yucca.

Monitoring ParametersSigns/symptoms of venous thromboembolism; blood pressure, breast exam, Pap smear, and pregnancy; lipid profiles in patients being treated for hyperlipidemias; follow-up examination 3 months after initiation of therapy

Monitoring: Lab TestsPap smear, pregnancy; lipid profiles in patients being treated for hyperlipidemias

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. CAN = [Canadian brand name]

Tablet: Diane-35 [CAN]: Cyproterone 2 mg and ethinyl estradiol 0.35 mg (21s) [not available in the U.S.]

ManufacturerBerlex (Canada)

Mechanism of Action

Ethinyl estradiol: Estrogens are responsible for the development and maintenance of the female reproductive system and secondary sexual characteristics. Estrogens modulate the pituitary secretion of gonadotropins, luteinizing hormone, and follicle-stimulating hormone through a negative feedback system. Estrogen increases levels of sex hormone-binding globulin (SHBG) and may reduce unbound androgen levels. Ethinyl estradiol is a synthetic derivative of estradiol. The addition of the ethinyl group prevents rapid degradation by the liver.

Cyproterone: Steroidal compound with antiandrogenic, antigonadotropic and progestin-like activity.

Pharmacodynamics/Kinetics

Cyproterone:

Absorption: Rapid and complete

Metabolism: Hepatic; some metabolites have activity

Half-life elimination: 38 hours

Time to peak: 3-4 hours

Excretion: As metabolites: Urine (35%), feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression; use with caution

Mental Health: Effects on Psychiatric TreatmentCarbamazepine phenobarbital, phenytoin, and St John's wort may increase the metabolism of ethinyl estradiol. Concomitant use with benzodiazepines may result in altered clearance of benzodiazepines; monitor. Effects of selegiline and tricyclic antidepressants may be potentiated in combined use with ethinyl estradiol.

Cardiovascular ConsiderationsIt is important to recognize that estrogen/antiandrogen combinations may induce or worsen hypertension. These problems are less severe with low doses. Furthermore, these agents may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on long-term therapy undergo monitoring of blood pressure and avoid cigarette use.

Index TermsEthinyl Estradiol and Cyproterone Acetate

International Brand NamesAlthea (PH); Brenda-35 ED (AU); Claudia (BE); Cyprodiol (BE); Daphne (BE, HK); Diane (EE, FI, IN, MX, NO, SE); Diane 35 (AR, BR, CH, CL, CN, CZ, DE, DK, EE, FR, HK, ID, IL, KP, MY, PE, PH, PK, PY, SG, TH); Diane 35 Diario (ES); Diane-35 (CO, UY, VE, ZA); Diane-35 ED (AU); Dianette (IE); Diva-35 (ZA); Dixi-35 (CN, EC, PE, PY); Estelle -35 (IL, MY, SG); Estelle-35 ED (AU); Eunice-35 (MX); Evepar (FR); Femina-35 (EE); Feminil (NO); Holgyeme (FR); Lady-Ten 35 (CN); Minerva-35 (ZA); Zyrona (SE)

Cyproterone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(sye PROE ter one)
Canadian Brand NamesAndrocur®; Androcur® Depot; Apo-Cyproterone®; Gen-Cyproterone; Novo-Cyproterone
Pharmacologic CategoryAntiandrogen
Use: Labeled IndicationsPalliative treatment of advanced prostate carcinoma
Dosing: AdultsProstatic carcinoma (palliative treatment): Males:

Oral: 200-300 mg/day in 2-3 divided doses; following orchiectomy, reduce dose to 100-200 mg/day; should be taken with meals

I.M. (depot): 300 mg (3 mL) once weekly; reduce dose in orchiectomized patients to 300 mg every 2 weeks

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentUse is contraindicated.
Dosing: Hepatic ImpairmentUse is contraindicated with hepatic impairment or active liver disease.
Administration: OralAdminister at the same time each day. Take with meals.
StorageStore at controlled room temperature of 25°C (77°F).
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to cyproterone or any component of the formulation; active liver disease or hepatic dysfunction; renal impairment
Warnings/Precautions

Concerns related to adverse effects:

- Hepatic toxicity: Has been associated with hepatic toxicity (jaundice, hepatitis, hepatic failure); typically this toxicity develops after several months of therapy. Monitor hepatic function and consider discontinuation of therapy in patients with evidence of hepatic injury.
- Lipid effects: May increase HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.
- Thromboembolism: May increase the risk of thromboembolism.

Disease-related concerns:

- Cardiovascular disease: Use with caution in conditions that may be aggravated by fluid retention, or cardiovascular disease.
- Depression: Use with caution in patients with a history of depression; has been associated with an increased incidence of depression, particularly early in the course of therapy (initial 6-8 weeks).
- Diabetes: Use with caution in patients with diabetes or impaired glucose tolerance, may cause alterations in glucose metabolism.

Pregnancy Risk FactorNot indicated for use in women
Pregnancy ConsiderationsIn males, sperm count and volume of ejaculate will be reduced. After ~2 months of treatment, infertility may be noted.
Adverse ReactionsFrequency not defined.

Cardiovascular: Heart failure, hemorrhage, hypotension, MI, stroke, shock, stroke, syncope, tachycardia, thrombosis (DVT, pulmonary embolism, retinal vein thrombosis)

Central nervous system: Depression, dizziness, encephalopathy, fatigue, headache, lassitude

Dermatologic: Dry skin (sebum reduction), eczema, erythema, exfoliative dermatitis, hirsutism, nodosum, patchy loss of body hair, photosensitivity, pruritus, rash, scleroderma, skin discoloration, urticaria

Endocrine & metabolic: Adrenal suppression (dose related), benign nodular breast hyperplasia, diabetes mellitus, galactorrhea, gynecomastia, hot flashes, hypercalcemia, hyperglycemia, impotence, inhibition of spermatogenesis, libido increased, negative nitrogen balance, weight gain/loss

Gastrointestinal: Anorexia, constipation, diarrhea, dyspepsia, glossitis, nausea, pancreatitis, vomiting

Genitourinary: Bladder carcinoma, hematuria, urinary frequency

Hematologic: Anemia, fibrinogen increased, hemolytic anemia, leukopenia, leukocytosis, PT decreased, thrombocytopenia

Hepatic: Ascites, cholestatic jaundice, cirrhosis, hepatic dysfunction (dose related), hepatic carcinoma, hepatic coma, hepatic failure, hepatic necrosis, hepatitis, hepatoma, hepatomegaly, transaminases increased

Local: Injection site reaction

Neuromuscular and skeletal: Myasthenia, osteoporosis, weakness

Ocular: Abnormal accommodation, abnormal vision, blindness, optic neuritis, optic atrophy, retinal disorder

Renal: Renal failure, serum creatinine increased

Respiratory: Asthma, bronchospasm, cough, dyspnea, pulmonary embolism, pulmonary fibrosis

Miscellaneous: Allergic reaction

Drug Interactions

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: May reduce the effect of cyproterone (not established in the treatment of prostatic carcinoma); avoid concurrent use.

Monitoring Parameters

Liver function tests should be performed at baseline and periodically thereafter, or whenever signs or symptoms suggestive of hepatotoxicity are noted. Adrenal function should be monitored periodically.

Monitoring: Lab Tests

Liver function tests should be performed at baseline and periodically thereafter, or whenever signs or symptoms suggestive of hepatotoxicity are noted. Adrenal function should be monitored periodically.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as acetate (Androcur® Depot): 100 mg/mL (3 mL) [contains benzyl benzoate and castor oil]

Tablet, as acetate (Androcur®): 50 mg

Generic Available

Yes

Mechanism of Action

Cyproterone is a steroidal compound with antiandrogenic, antigonadotropic, and progestin-like activity.

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid and complete

Metabolism: Hepatic, some metabolites have activity

Half-life elimination: Oral: 38 hours; Depot injection: 4 days

Time to peak, plasma: Oral: 3-4 hours; Depot injection: 3 days

Excretion: Urine (35%, as metabolites); feces (60%)

Dental Health: Effects on Dental Treatment

Key adverse event(s) related to dental treatment: Glossitis

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

No information available to require special precautions

Mental Health: Effects on Mental Status

May cause dizziness; associated with an increased incidence of depression early in the course of therapy; use with caution

Mental Health: Effects on Psychiatric Treatment

None reported

Cysteamine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(sis TEE a meen)

U.S. Brand NamesCystagon®

Pharmacologic CategoryAnticystine Agent; Urinary Tract Product

Use: Labeled IndicationsTreatment of nephropathic cystinosis

Dosing: AdultsManagement of nephropathic cystinosis: Oral: Adults (>110 lb): Initiate therapy with $^{1}/_{4}$ to $^{1}/_{6}$ of maintenance dose; titrate slowly upward over 4-6 weeks. **Note:** Dosage may be increased if cystine levels are <1 nmol/$^{1}/_{2}$ cystine/mg protein, although intolerance and incidence of adverse events may be increased.

Maintenance: 2 g/day in 4 divided doses; maximum dose: 1.95 g/m^2/day or 90 mg/kg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricManagement of nephropathic cystinosis: Oral: Initiate therapy with $^{1}/_{4}$ to $^{1}/_{6}$ of maintenance dose; titrate slowly upward over 4-6 weeks. **Note:** Dosage may be increased if cystine levels are <1 nmol/$^{1}/_{2}$ cystine/mg protein, although intolerance and incidence of adverse events may be increased.

Children <12 years: Maintenance: 1.3 g/m^2/day or 60 mg/kg/day divided into 4 doses (maximum dose: 1.95 g/m^2/day or 90 mg/kg/day

Children >12 years and >110 lbs: Refer to adult dosing.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: OralSprinkle capsule contents over food or mix in formula if unable to swallow capsule.

StorageStore at 20°C to 25°C (68°F to 77°F). Protect from light and moisture.

ContraindicationsHypersensitivity to cysteamine, penicillamine, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Bone lesions: Osteopenia, compression fractures, scoliosis, and genu valgum, accompanied by leg pain and joint hyperextension may occur with higher doses; dosage reduction may be required.
- CNS symptoms: Adjust dose if CNS symptoms (eg, depression, lethargy, seizure) related to drug use (rather than the disease) develop. May impair mental alertness; patients should use caution when driving or operating heavy machinery until the effects are known.
- Dermatologic: Withhold if a mild-to-moderate rash develops; restart at a lower dose and titrate to therapeutic dose. Do not rechallenge with severe skin rash (erythema multiforme bullosa or toxic epidermal necrolysis). Skin lesions, appearing as hemorrhagic lesions (on the upper extremities), molluscoid pseudotumors or skin striae have been reported with higher doses; dosage reduction may be required.
- Gastrointestinal symptoms: Gastrointestinal ulcers and bleeding have been reported; promptly evaluate if signs and symptoms occur; adjust dose downward if severe GI symptoms develop (most common during initiation of therapy).
- Hematologic: May cause reversible leukopenia.
- Hepatic: May cause abnormal liver functions studies.
- Intracranial hypertension/papilledema: Intracranial hypertension (pseudotumor cerebri) and/or papilledema have been reported with treatment; may be managed with diuretics.

Pregnancy Risk FactorC

Pregnancy ConsiderationsUse only when the potential benefits outweigh the potential hazards to the fetus; in animal studies, cysteamine is teratogenic and fetotoxic. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is unknown whether cysteamine is excreted in breast milk. Discontinue nursing or discontinue drug during lactation.

Adverse Reactions

>5%:

Central nervous system: Fever (22%), lethargy (11%)

Dermatologic: Rash (7%)

Gastrointestinal: Vomiting (35%), anorexia (31%), diarrhea (16%)

<5%:

Cardiovascular: Hypertension

Central nervous system: Abnormal thinking, ataxia, confusion, depression, dizziness, emotional lability, encephalopathy, hallucinations, headache, impaired cognition, jitteriness, nervousness, nightmares, seizure, somnolence

Dermatologic: Urticaria

Endocrine & metabolic: Dehydration

Gastrointestinal: Abdominal pain, bad breath, constipation, duodenal ulceration, duodenitis, dyspepsia, gastroenteritis, gastrointestinal bleeding, gastrointestinal ulcers, nausea

Hematologic: Anemia, leukopenia

Hepatic: Abnormal LFTs

Neuromuscular & skeletal: Hyperkinesia, tremor

Otic: Hearing decreased

Postmarketing and/or case reports: Compression fracture, genu valgum, hyperthermia, interstitial nephritis, intracranial hypertension (benign), joint hyperextension, leg pain, lethargy, molluscoid pseudotumor, osteopenia, papilledema, pseudotumor cerebri, rash, renal failure, scoliosis, skin fragility, skin lesion, skin striae

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersBlood counts and LFTs during therapy; signs and symptoms of gastrointestinal ulceration and bleeding. Monitor leukocyte cystine measurements every 3 months to determine adequate dosage and compliance (measure 5-6 hours after administration); monitor more frequently when switching salt forms. Ophthalmic examination (periodic).

Reference RangeLeukocyte cystine:

Normal individual: <0.2 $\text{nmol/}^{1}/_{2}$ cystine/mg protein

Cystinosis target: <1 $\text{nmol/}^{1}/_{2}$ cystine/mg protein (if poor tolerability to cysteamine, may still benefit from leukocyte cystine levels <2 $\text{nmol/}^{1}/_{2}$ cystine/mg protein)

Nursing: Physical Assessment/MonitoringMonitor all laboratory results. Monitor or instruct patient to monitor for adverse reactions; especially CNS changes, GI disturbances, or rash. If reactions are noted, medication should be held until reactions clear, and medication started at a lower dose.

Monitoring: Lab TestsBlood counts and LFTs during therapy; monitor leukocyte cystine measurements every 3 months to determine adequate dosage and compliance (measure 5-6 hours after administration); monitor more frequently when switching salt forms

Patient EducationTake as directed. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. It may be necessary to include other medication in treatment regimen. Periodic blood tests will need to be performed. You may experience dizziness, confusion, or lethargy; use caution with tasks that require alertness until response to drug is known; nausea and/or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (yogurt, boiled milk, or buttermilk may help). Report fever, gastric disturbances, or rash. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Cystagon®: 50 mg, 150 mg

Generic AvailableNo

Mechanism of ActionReacts with cystine within the lysosome to convert it to cysteine and to a cysteine-cysteamine mixed disulfide, both of which can then exit the lysosome in patients with cystinosis, an inherited defect of lysosomal transport

Pharmacodynamics/KineticsAs reported in children:

Onset: 1-1.8 hours

Duration: 6 hours

Distribution: V_d: 156 L

Protein binding: ~52%, predominantly to albumin

Time to peak, plasma: 1.4 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause confusion, nervousness, impaired cognition, and hallucinations

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropic may produce additive sedation

Index TermsCysteamine Bitartrate

References

Gahl WA, Thoene JG, and Schneider JA, “Cystinosis,” *N Engl J Med*, 2002, 347(2):111-21.[PubMed 12110740]

International Brand NamesCystagon (AT, AU, BE, BG, CH, CZ, DE, DK, ES, FI, FR, GB, GR, HN, IE, IT, NL, NO, PT, RU, SE, TR)

Jump To Field (Select Field Name)

Pronunciation(SIS te een)
U.S. Brand NamesCysteine-500
Pharmacologic CategoryNutritional Supplement
Use: Labeled IndicationsSupplement to crystalline amino acid solutions, in particular the specialized pediatric formulas (eg, Aminosyn® PF, TrophAmine®) to meet the intravenous amino acid nutritional requirements of infants receiving parenteral nutrition (PN)
Dosing: PediatricNutritional supplement: I.V.: Neonates and Infants (receiving PN): Added as a fixed ratio to crystalline amino acid solution: 40 mg cysteine per g of amino acids; dosage will vary with the daily amino acid dosage (eg, 0.5-2.5 g/kg/day amino acids would result in 20-100 mg/kg/day cysteine). Individual doses of cysteine of 0.8-1 mmol/kg/day have also been added directly to the daily PN solution. The duration of treatment relates to the need for PN. Patients on chronic PN therapy have received cysteine until 6 months of age and in some cases until 2 years of age.
StorageAvoid excessive heat. Do not freeze. When combined with parenteral amino acid solutions, cysteine is relatively unstable. It is intended to be added immediately prior to administration to the patient. Infusion of the admixture should begin within 1 hour of mixing or refrigerated until use. Stable 24 hours in PN solution; opened vials must be used within 4 hours of entry.
ContraindicationsHypersensitivity to cysteine or any component of the formulation; patients with hepatic coma or metabolic disorders involving impaired nitrogen utilization
Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Infants: Metabolic acidosis has occurred in infants related to the “hydrochloride” component of cysteine; each 1 mmol cysteine (175 mg) delivers 1 mEq chloride and 1 mEq hydrogen ion; to balance the extra hydrochloride ions and prevent acidosis addition to the PN solution of a 1 mEq acetate electrolyte salt for each mmol (175 mg) of cysteine may be needed; each 40 mg cysteine (equal to every 1 g amino acid when used in the recommended ratio) adds 0.228 mEq chloride and hydrogen.

Adverse ReactionsFrequency not defined.

Central nervous system: Fever

Endocrine & metabolic: Metabolic acidosis

Gastrointestinal: Nausea

Renal: Azotemia, BUN increased

Monitoring ParametersBUN, ammonia, electrolytes, pH, acid-base balance, serum creatinine, liver function tests, growth curve
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Cysteine-500: 500 mg

Injection, solution, as hydrochloride: 50 mg/mL (10 mL, 50 mL)

Generic AvailableYes
Mechanism of ActionCysteine is a sulfur-containing amino acid synthesized from methionine via the transulfuration pathway. It is a precursor of the tripeptide glutathione and also of taurine. Newborn infants have a relative deficiency of the enzyme necessary to affect this conversion. Cysteine may be considered an essential amino acid in infants.
Pharmacotherapy PearlsAddition of cysteine to PN solutions enhances the solubility of calcium and phosphate by lowering the overall pH of the solution.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsCysteine Hydrochloride

Cytarabine (Liposomal)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Cytarabine may be confused with Cytadren®, Cytosar®, Cytoxan®, vidarabine

Cytarabine liposomal may be confused with conventional cytarabine

DepoCyt® may be confused with Depoject®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(sye TARE a been lip po SOE mal)

U.S. Brand NamesDepoCyt®

Canadian Brand NamesDepoCyt®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite (Pyrimidine Antagonist)

Use: Labeled IndicationsTreatment of lymphomatous meningitis

Dosing: Adults**Note: Patients should be started on dexamethasone 4 mg twice daily (oral or I.V.) for 5 days, beginning on the day of cytarabine liposomal injection**

Lymphomatous meningitis: I.T.:

Induction: 50 mg every 14 days for a total of 2 doses (weeks 1 and 3)

Consolidation: 50 mg every 14 days for 3 doses (weeks 5, 7, and 9), followed by an additional dose at week 13

Maintenance: 50 mg every 28 days for 4 doses (weeks 17, 21, 25, and 29)

Dosing: ElderlyRefer to adult dosing.

Dosing: Adjustment for ToxicityIf drug-related neurotoxicity develops, reduce dose to 25 mg. If toxicity persists, discontinue treatment.

Administration: OtherFor intrathecal use only. Dose should be removed from vial immediately before administration (must be administered within 4 hours of removal). An in-line filter should **not** be used. Administer directly into the CSF via an intraventricular reservoir or by direct injection into the lumbar sac. Injection should be made slowly (over 1-5 minutes). Patients should lie flat for 1 hour after lumbar puncture.

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from freezing and avoid aggressive agitation. Solutions should be used within 4 hours of withdrawal from the vial.

ReconstitutionAllow vial to warm to room temperature prior to withdrawal from vial. Particles may settle in diluent over time, and may be resuspended by gentle agitation or inversion of the vial. Further reconstitution or dilution is not required.

ContraindicationsHypersensitivity to cytarabine or any component of the formulation; active meningeal infection

Warnings/Precautions

Boxed warnings:

- Chemical arachnoiditis: See “Concerns related to adverse effects” below.

- Experienced physician: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Chemical arachnoiditis: **[U.S. Boxed Warning]: Chemical arachnoiditis (nausea, vomiting, headache, fever) occurs commonly; may be fatal if untreated. The incidence and severity of chemical arachnoiditis is reduced by coadministration with dexamethasone.** Hydrocephalus has been reported and may be precipitated by chemical arachnoiditis.

- Meningitis: Infectious meningitis may be associated with intrathecal administration.

- Neurotoxicity: May cause neurotoxicity (including myelopathy), which may lead to permanent neurologic deficit; blockage to CSF flow may increase the risk of neurotoxicity. Monitor for neurotoxicity. Reduce subsequent doses; discontinue with persistent neurotoxicity. Peripheral neurotoxicity has also been reported.

Concurrent drug therapy issues:

- Systemic chemotherapy: The risk of adverse events, including neurotoxicity, is increased with concurrent systemic chemotherapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Radiation therapy recipients: The risk of adverse events, including neurotoxicity, is increased in patients receiving concurrent radiation therapy.

Other warnings/precautions:

- Administration: For intrathecal use only.
- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsReproductive studies have not been conducted with cytarabine liposomal. Cytarabine, the active component, has been associated with fetal malformations when given as a component of combination chemotherapy during the first trimester. Systemic exposure following intrathecal administration of cytarabine liposomal is negligible. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant during treatment.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsAlthough the systemic exposure following intrathecal administration of cytarabine liposomal is negligible, breast-feeding is not recommended due to the potential for serious adverse reactions in the nursing infant.

Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (11%)

Central nervous system: Chemical arachnoiditis (without dexamethasone premedication: 100%; with dexamethasone premedication: 33% to 42%; grade 4: 19% to 30%; onset: ≤5 days); headache (56%), confusion (33%), fever (32%), fatigue (25%), seizure (20% to 22%), dizziness (18%), lethargy (16%), insomnia (14%), memory impairment (14%), pain (14%)

Endocrine & metabolic: Dehydration (13%)

Gastrointestinal: Nausea (46%), vomiting (44%), constipation (25%), diarrhea (12%), appetite decreased (11%)

Genitourinary: Urinary tract infection (14%)

Hematologic: Anemia (12%), thrombocytopenia (3% to 11%)

Neuromuscular & skeletal: Weakness (40%), back pain (24%), abnormal gait (23%), limb pain (15%), neck pain (14%), arthralgia (11%), neck stiffness (11%)

Ocular: Blurred vision (11%)

1% to 10%:

Cardiovascular: Tachycardia (9%), hypotension (8%), hypertension (6%), syncope (3%), edema (2%)

Central nervous system: Agitation (10%), hypoesthesia (10%), depression (8%), anxiety (7%), sensory neuropathy (3%)

Dermatologic: Pruritus (2%)

Endocrine & metabolic: Hypokalemia (7%), hyponatremia (7%), hyperglycemia (6%)

Gastrointestinal: Abdominal pain (9%), dysphagia (8%), anorexia (5%), hemorrhoids (3%), mucosal inflammation (3%)

Genitourinary: Incontinence (7%), urinary retention (5%)

Hematologic: Neutropenia (10%), contusion (2%)

Neuromuscular & skeletal: Muscle weakness (10%), tremor (9%), peripheral neuropathy (4%), abnormal reflexes (3%)

Otic: Hypoacusis (6%)

Respiratory: Dyspnea (10%), cough (7%), pneumonia (6%)

Miscellaneous: Diaphoresis (2%)

<1%, postmarketing, and/or case reports: Anaphylaxis, bladder control impaired, blindness, bowel control impaired, cauda equine syndrome, cranial nerve palsies, CSF protein increased, CSF WBC increased, deafness, encephalopathy, hemiplegia, hydrocephalus, infectious meningitis, intracranial pressure increased, myelopathy, neurologic deficit, numbness, papilledema, somnolence, visual disturbance

Oncology: VesicantNo

Oncology: Emetic PotentialModerate (30% to 60%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be

increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Test InteractionsSince cytarabine liposomes are similar in appearance to WBCs, care must be taken in interpreting CSF examinations in patients receiving cytarabine liposomal.

Monitoring ParametersMonitor closely for signs of an immediate reaction; neurotoxicity

Nursing: Physical Assessment/MonitoringShould be administered under the supervision of an experienced cancer chemotherapy physician. This medication is only for intrathecal administration. Patient must be monitored continuously for adverse reactions that can be immediate (eg, neurotoxicity [eg, myelopathy, ataxia, confusion, coma] and chemical arachnoiditis [eg, neck pain, neck rigidity, headache, fever, nausea, vomiting, back pain]); potential for adverse reactions increased with concurrent radiation therapy or systemic chemotherapy. Incidence and severity of chemical arachnoiditis is reduced by coadministration with dexamethasone. Provide patient teaching according to patient condition.

Monitoring: Lab TestsSince cytarabine liposomes are similar in appearance to WBCs, care must be taken in interpreting CSF examinations in patients receiving cytarabine liposomal.

Patient EducationPatient instruction will be according to mental status. This medication can only be given by infusion into the spinal cord. You will be monitored closely during and after each infusion. Report immediately any neck pain or rigidity, headache, fever, nausea, or vomiting. Report any swelling of extremities, acute weakness, unusual gait pattern, CNS changes (confusion, speech difficulty), or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension, intrathecal [preservative free]:

Depocyt®: 10 mg/mL (5 mL)

Generic AvailableNo

Mechanism of ActionCytarabine liposomal is a sustained-release formulation of the active ingredient cytarabine, an antimetabolite which acts through inhibition of DNA synthesis and is cell cycle-specific for the S phase of cell division. Cytarabine is converted intracellularly to its active metabolite cytarabine-5'-triphosphate (ara-CTP). Ara-CTP also appears to be incorporated into DNA and RNA; however, the primary action is inhibition of DNA polymerase, resulting in decreased DNA synthesis and repair. The liposomal formulation allows for gradual release, resulting in prolonged exposure.

Pharmacodynamics/Kinetics

Absorption: Systemic exposure following intrathecal administration is negligible since transfer rate from CSF to plasma is slow

Half-life elimination, CSF: 6-82 hours

Time to peak, CSF: Intrathecal: <1 hour

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusCerebellar syndrome is common; may cause dizziness, confusion, or sedation

Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common; use caution with clozapine and carbamazepine. GI side effects are common and dose related; use caution with SSRIs.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Cytarabine may be confused with Cytadren®, Cytosar®, Cytoxan®, vidarabine

Cytarabine (conventional) may be confused with cytarabine liposomal

Cytosar-U may be confused with cytarabine, Cytovene®, Cytoxan®, Neosar®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(sye TARE a been)

Canadian Brand NamesCytosar®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite; Antineoplastic Agent, Antimetabolite (Pyrimidine Analog)

Use: Labeled IndicationsTreatment of acute myeloid leukemia (AML), acute lymphocytic leukemia (ALL), chronic myelocytic leukemia (CML; blast phase), and lymphomas; prophylaxis and treatment of meningeal leukemia

Dosing: AdultsI.V.: Refer to individual protocols.

Remission induction:

I.V.: 100-200 mg/m^2/day for 5-10 days; a second course, beginning 2-4 weeks after the initial therapy, may be required in some patients.

or 100 mg/m^2/day for 7 days

or 100 mg/m^2/dose every 12 hours for 7 days

I.T.: 5-75 mg/m^2 every 2-7 days until CNS findings normalize

Remission maintenance:

I.V.: 70-200 mg/m^2/day for 2-5 days at monthly intervals

I.M., SubQ: 1-1.5 mg/kg single dose for maintenance at 1- to 4-week intervals

High-dose therapies for leukemia/lymphoma (unlabeled use):

Doses as high as 1-3 g/m^2 have been used for refractory or secondary leukemias or refractory non-Hodgkin's lymphoma.

Doses of 1-3 g/m^2 every 12 hours for up to 12 doses have been used

Bone marrow transplant (unlabeled use): 1.5 g/m^2 continuous infusion over 48 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols.

Remission induction:

I.V.: 75-200 mg/m^2/day for 5- to 10-day therapy course or every day until remission

I.T.: Usual dose 30 mg/m^2/dose every 4 days; range: 5-75 mg/m^2 every 2-7 days until CNS findings normalize **or** age-based dosing (frequency of administration usually defined by protocol):

<1 year of age: 15-20 mg per dose

1-2 years of age: 16-30 mg per dose

2-3 years of age: 20-50 mg per dose

>3 years of age: 24-75 mg per dose

Remission maintenance: Refer to adult dosing.

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain renal dosing adjustment guidelines; the following guidelines have been used by some clinicians:

Aronoff, 2007 (cytarabine 100-200 mg/m^2): Children and Adults: No adjustment necessary

Kintzel, 1995 (high-dose cytarabine 1-3 g/m^2):

- Cl_{cr} 46-60 mL/minute: Administer 60% of dose
- Cl_{cr} 31-45 mL/minute: Administer 50% of dose
- Cl_{cr} <30 mL/minute: Consider use of alternative drug

Smith, 1997 (high-dose cytarabine ≥2 g/m^2/dose):

- Serum creatinine 1.5-1.9 mg/dL or increase (from baseline) of 0.5-1.2 mg/dL: Reduce dose to 1 g/m^2/dose
- Serum creatinine ≥2 mg/dL or increase (from baseline) of >1.2 mg/dL: Reduce dose to 0.1 g/m^2/day as a continuous infusion

Dosing: Hepatic ImpairmentDose may need to be adjusted in patients with liver failure since cytarabine is partially detoxified in the liver. The FDA-approved labeling does not contain hepatic dosing adjustment guidelines; the following guideline has been used by some clinicians:

Floyd, 2006: AST/ALT (any elevation): Administer 50% of dose; may increase subsequent doses in the absence of toxicities

Koren, 1992 (dose level not specified): Bilirubin >2 mg/dL: Administer 50% of dose; may increase subsequent doses in the absence of toxicities

Dosing: Combination Regimens

Oncology: Bone Marrow - High DoseI.V.: 2-3 g/m^2/dose every 12-24 hours for 4-12 doses; duration of infusion is 1-3 hours; maximum single-agent dose: 36 g/m^2; generally combined with other high-dose chemotherapeutic drugs or total body irradiation (TBI).

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.I.V. infusion over 1-3 hours or as a continuous infusion. GI effects may be more pronounced with divided I.V. bolus doses than with continuous infusion.

Administration: I.V. DetailpH: 7.4-7.7

BMT only: Risk of cerebellar toxicity increases with creatinine clearance <60 mL/minute, age older than 50 years, pre-existing CNS lesion, and alkaline phosphatase levels exceeding 3 times the upper limit of normal. Conjunctivitis is prevented and treated with saline or corticosteroid eye drops. As prophylaxis, eye drops should be started 6-12 hours before initiation of cytarabine and continued 24 hours following the last dose.

Administration: OtherMay be administered I.M., I.T., or SubQ at a concentration not to exceed 100 mg/mL.

Storage

Powder for reconstitution: Store intact vials of powder at room temperature 15°C to 30°C (59°F to 86°F). Reconstituted solutions are stable for up to 8 days at room temperature, although the manufacturer recommends use within 48 hours.

Solution: Prior to dilution, store at room temperature, 15°C to 30°C (59°F to 86°F); protect from light. Do not refrigerate solution; precipitate may form.

ReconstitutionReconstitute powder with bacteriostatic water for injection, bacteriostatic 0.9% NaCl.

For I.T. use: Reconstitute with preservative free diluent.

For I.V. infusion: Dilute in 250-1000 mL 0.9% NaCl or D_5W.

Note: Solutions containing bacteriostatic agents should not be used for the preparation of either high doses or intrathecal doses of cytarabine; may be used for I.M., SubQ, and low-dose (100-200 mg/m^2) I.V. solution.

CompatibilityStable in D_5LR, $D_5{}^1/_4NS$, D_5NS, $D_{10}NS$, D_5W, LR, NS.

Y-site administration: Compatible: Amifostine, amsacrine, aztreonam, cefepime, chlorpromazine, cimetidine, cladribine, dexamethasone sodium phosphate, diphenhydramine, doxorubicin liposome, droperidol, etoposide phosphate, famotidine, filgrastim, fludarabine, furosemide, gatifloxacin, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, idarubicin, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone sodium succinate, metoclopramide, morphine, ondansetron, paclitaxel, piperacillin/tazobactam, prochlorperazine edisylate, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, teniposide, thiotepa, vinorelbine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, ganciclovir.

Compatibility in syringe: Compatible: Metoclopramide.

Compatibility when admixed: Compatible: Corticotropin, dacarbazine, daunorubicin with etoposide, etoposide, hydroxyzine, lincomycin, methotrexate, mitoxantrone, ondansetron, potassium chloride, sodium bicarbonate, vincristine. **Incompatible:** Fluorouracil, heparin, insulin (regular), nafcillin, oxacillin, penicillin G sodium. **Variable (consult detailed reference):** Gentamicin, hydrocortisone sodium succinate, methylprednisolone sodium succinate.

ContraindicationsHypersensitivity to cytarabine or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Myelosuppression: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Cytarabine syndrome: Characterized by fever, myalgia, bone pain, chest pain, maculopapular rash, conjunctivitis, and malaise, cytarabine syndrome may occur 6-12 hours following administration; may be managed with corticosteroids.

- Myelosuppression: **[U.S. Boxed Warning]: Potent myelosuppressive agent;** use with caution in patients with prior bone marrow suppression; monitor for signs of febrile neutropenia.

- Pancreatitis: There have been reports of acute pancreatitis in patients receiving continuous infusion and in patients previously treated with L-asparaginase.

- Tumor lysis syndrome: With high dose therapy, tumor lysis syndrome and subsequent hyperuricemia may occur; consider allopurinol and hydrate accordingly.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; may be at higher risk for CNS toxicities and dosage adjustments may be required.

- Renal impairment: Use with caution in patients with impaired renal function (high dose cytarabine); may be at higher risk for CNS toxicities and dosage adjustments may be required.

Concurrent drug therapy issues:

- Cylcophosphamide: There have been case reports of fatal cardiomyopathy when high-dose cytarabine was used in combination with cyclophosphamide as a preparation regimen for transplantation.

Dosage form specific issues:

- Benzyl alcohol: Some products may contain benzyl alcohol; do not use products containing benzyl alcohol or products reconstituted with bacteriostatic diluent intrathecally or for high-dose cytarabine regimens.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

- High dose treatment: High dose regimens have been associated with GI, CNS, pulmonary, ocular (prophylaxis with ophthalmic corticosteroids is recommended) toxicities, and cardiomyopathy. Neurotoxicity associated with high-dose treatment may present as acute cerebellar toxicity or may be severe with seizure and/or coma; may be delayed, occurring up to 3-8 days after treatment has begun; possibly irreversible. Risk factors for neurotoxicity include cumulative cytarabine dose, prior CNS disease and renal impairment (incidence may be up to 55% in patients with renal impairment).

Pregnancy Risk FactorD

Pregnancy ConsiderationsCytarabine is teratogenic in animal studies. Limb and ear defects have been noted in case reports when cytarabine has been used during pregnancy. The following have also been noted in the neonate: Pancytopenia, WBC depression, electrolyte abnormalities, prematurity, low birth weight, decreased hematocrit or platelets. Risk to the fetus is decreased if therapy is avoided during the 1st trimester; however, women of childbearing potential should be advised of the potential risks.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions**Note:** Frequency not defined.

Frequent:

Central nervous system: Fever

Dermatologic: Rash

Gastrointestinal: Anal inflammation, anal ulceration, anorexia, diarrhea, mucositis, nausea, vomiting

Hematologic: Myelosuppression, neutropenia (onset: 1-7 days; nadir [biphasic]: 7-9 days and at 15-24 days; recovery [biphasic]: 9-12 and at 24-34 days), thrombocytopenia (onset: 5 days; nadir: 12-15 days; recovery 15-25 days), anemia, bleeding, leukopenia, megaloblastosis, reticulocytes decreased

Hepatic: Hepatic dysfunction, transaminases increased (acute)

Local: Thrombophlebitis

Less frequent:

Cardiovascular: Chest pain, pericarditis

Central nervous system: Dizziness, headache, neural toxicity, neuritis

Dermatologic: Alopecia, pruritus, skin freckling, skin ulceration, urticaria

Gastrointestinal: Abdominal pain, bowel necrosis, esophageal ulceration, esophagitis, pancreatitis, sore throat

Genitourinary: Urinary retention

Hepatic: Jaundice

Local: Injection site cellulitis

Ocular: Conjunctivitis

Renal: Renal dysfunction

Respiratory: Dyspnea

Miscellaneous: Allergic edema, anaphylaxis, sepsis

Infrequent and/or case reports: Amylase increased, aseptic meningitis, cardiopulmonary arrest (acute), cerebral dysfunction, cytarabine syndrome (bone pain, chest pain, conjunctivitis, fever, maculopapular rash, malaise, myalgia); exanthematous pustulosis, hyperuricemia, injection site inflammation (SubQ injection), injection site pain (SubQ injection), interstitial pneumonitis, lipase increased, paralysis (intrathecal and I.V. combination therapy), rhabdomyolysis, veno-occlusive liver disease

Adverse events associated with high-dose cytarabine (CNS, gastrointestinal, ocular, and pulmonary toxicities are more common with high-dose regimens):

Cardiovascular: Cardiomegaly, cardiomyopathy (in combination with cyclophosphamide)

Central nervous system: Coma, neurotoxicity (dose-related, cerebellar toxicity may occur in patients receiving high-dose cytarabine [>36-48 g/m^2/cycle]; incidence may up to 55% in patients with renal impairment), personality change, somnolence

Dermatologic: Alopecia (complete), desquamation, rash (severe)

Gastrointestinal: Gastrointestinal ulcer, peritonitis, pneumatosis cystoides intestinalis

Hepatic: Hyperbilirubinemia, liver abscess, liver damage, necrotizing colitis

Neuromuscular & skeletal: Peripheral neuropathy (motor and sensory)

Ocular: Corneal toxicity, hemorrhagic conjunctivitis

Respiratory: Pulmonary edema, syndrome of sudden respiratory distress

Miscellaneous: Sepsis

Adverse events associated with intrathecal cytarabine administration:

Central nervous system: Accessory nerve paralysis, fever, necrotizing leukoencephalopathy (with concurrent cranial irradiation, I.T. methotrexate, and I.T. hydrocortisone), neurotoxicity, paraplegia

Gastrointestinal: Dysphagia, nausea, vomiting

Ocular: Blindness (with concurrent systemic chemotherapy and cranial irradiation), diplopia

Respiratory: Cough, hoarseness

Miscellaneous: Aphonia

Oncology: VesicantNo

Oncology: Emetic Potential

Low dose (<200 mg/m^2): Low (10% to 30%)

High dose (>1 g/m^2): Moderate-to-high (30% to 90%)

Oncology: Bone Marrow - Unique Toxicity

Central nervous system: Cerebellar toxicity which includes nystagmus, dysarthria, disdiadochokinesis, slurred speech; cerebral toxicity which includes somnolence, confusion

Dermatologic: Rash, desquamation may occur

Gastrointestinal: Severe nausea and vomiting, mucositis, diarrhea, ageusia

Ocular: Photophobia, excessive tearing, blurred vision, local discomfort, chemical conjunctivitis, optic neuropathy, visual loss

Respiratory: Noncardiogenic pulmonary edema (onset 22-27 days following completion of therapy)

Miscellaneous: Anosmia

Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Flucytosine: Cytarabine may diminish the therapeutic effect of Flucytosine. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersLiver function tests, CBC with differential and platelet count, serum creatinine, BUN, serum uric acid

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions (eg, additive myelosuppression, increased risk of cardiomyopathy, pancreatitis). See Administration for I.V. specifics. Premedicate with antiemetic, especially with larger doses. Ocular pain and conjunctivitis reactions may be reduced with premedication. Patient should be monitored closely for anaphylaxis, sudden onset respiratory distress (especially with high doses). Assess results of laboratory tests (BUN, urinalysis, and serum creatinine [hepatic function]; CBC and platelet count [myelosuppression]) prior to therapy and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions (eg, importance of adequate hydration) and adverse symptoms to report.

Monitoring: Lab TestsLiver function, CBC with differential and platelet count, serum creatinine, BUN, serum uric acid

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug is administered by infusion. You will be monitored closely during infusion. Report immediately any redness, swelling, burning, or pain at injection/infusion site; sudden difficulty breathing or swallowing, chest pain, or chills. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea, vomiting or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help - if ineffective, consult prescriber for antiemetic medication); diarrhea (buttermilk, boiled milk, or yogurt may help - if persistent, consult with prescriber); mouth sores (use soft toothbrush or cotton swabs for oral care); or dizziness, headache, or confusion (use caution when driving or engaging in potentially hazardous tasks until response to drug is known). Report immediately any signs of CNS changes, change in gait, respiratory distress or respiratory difficulty, easy bruising or bleeding, persistent GI upset, yellowing of eyes or skin, change in color of urine or blackened stool, or any other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 100 mg, 500 mg, 1 g, 2 g

Injection, solution: 20 mg/mL (5 mL, 25 mL, 50 mL); 100 mg/mL (20 mL)

Generic AvailableYes

Mechanism of ActionInhibits DNA synthesis. Cytosine gains entry into cells by a carrier process, and then must be converted to its active compound, aracytidine triphosphate. Cytosine is a pyrimidine analog and is incorporated into DNA; however, the primary action is inhibition of DNA polymerase resulting in decreased DNA synthesis and repair. The degree of cytotoxicity correlates linearly with incorporation into DNA; therefore, incorporation into the DNA is responsible for drug activity and toxicity. Cytarabine is specific for the S phase of the cell cycle (blocks progression from the G_1 to the S phase).

Pharmacodynamics/Kinetics

Distribution: V_d: Total body water; widely and rapidly since it enters the cells readily; crosses blood-brain barrier with CSF levels of 40% to 50% of plasma level

Metabolism: Primarily hepatic; metabolized by deoxycytidine kinase and other nucleotide kinases to aracytidine triphosphate (active); about 86% to 96% of dose is metabolized to inactive uracil arabinoside (ARA-U); intrathecal administration results in little conversion to ARA-U due to the low levels of deaminase in the cerebral spinal fluid

Half-life elimination: I.V.: Initial: 7-20 minutes; Terminal: 1-3 hours

Time to peak, plasma: I.M., SubQ: 20-60 minutes

Excretion: Urine (~80%; 90% as metabolite ARA-U) within 24 hours

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsI.V. doses ≥1.5 g/m^2 may produce conjunctivitis which can be ameliorated with prophylactic use of corticosteroid (0.1% dexamethasone) eye drops. Dexamethasone eye drops should be administered at 1-2 drops every 6 hours during and for 2-7 days after cytarabine is done.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation or confusion

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

Oncology: Bone Marrow CommentsRisk of cerebellar toxicity increases with creatinine clearance <60 mL/minute, age older than 50 years, pre-existing CNS lesion, and alkaline phosphatase levels exceeding 3 times the upper limit of normal. Conjunctivitis is prevented and treated with saline or corticosteroid eye drops. As prophylaxis, eye drops should be started 6-12 hours before initiation of cytarabine and continued 24 hours following the last dose.

Index TermsAra-C; Arabinosylcytosine; Cytarabine (Conventional); Cytarabine Hydrochloride; Cytosar-U; Cytosine Arabinosine Hydrochloride; NSC-63878

Medication Safety Issues

Sound-alike/look-alike issues:

CytoGam® may be confused with Cytoxan®, Gamimune® N

Pronunciation(sye toe meg a low VYE rus i MYUN GLOB yoo lin in tra VEE nus HYU man)
U.S. Brand NamesCytoGam®
Canadian Brand NamesCytoGam®
Pharmacologic CategoryImmune Globulin
Use: Labeled IndicationsProphylaxis of cytomegalovirus (CMV) disease associated with kidney, lung, liver, pancreas, and heart transplants; concomitant use with ganciclovir should be considered in organ transplants (other than kidney) from CMV seropositive donors to CMV seronegative recipients
Use: Unlabeled/InvestigationalAdjunct therapy in the treatment of CMV disease in immunocompromised patients
Dosing: Adults

Kidney transplant: I.V.:

Initial dose (within 72 hours of transplant): 150 mg/kg/dose

2, 4, 6, and 8 weeks after transplant: 100 mg/kg/dose

12 and 16 weeks after transplant: 50 mg/kg/dose

Liver, lung, pancreas, or heart transplant: I.V.:

Initial dose (within 72 hours of transplant): 150 mg/kg/dose

2, 4, 6, and 8 weeks after transplant: 150 mg/kg/dose

12 and 16 weeks after transplant: 100 mg/kg/dose

Severe CMV pneumonia: I.V.: Various regimens have been used, including 400 mg/kg CMV-IGIV in combination with ganciclovir on days 1, 2, 7, or 8, followed by 200 mg/kg CMV-IGIV on days 14 and 21

Dosing: ElderlyUse with caution in patients >65 years of age; elderly may be at increased risk of renal insufficiency.
Dosing: Renal ImpairmentUse with caution; specific dosing adjustments are not available. Infusion rate should be the minimum practical; do not exceed 180 mg/kg/hour.
Administration: I.V.For I.V. use only. Administer as separate infusion. Infuse beginning at 15 mg/kg/hour, then increase to 30 mg/kg/hour after 30 minutes if no untoward reactions. May titrate up to 60 mg/kg/hour. Do not administer faster than 75 mL/hour. Begin infusion within 6 hours of entering vial, complete infusion within 12 hours.
Administration: I.V. DetailAdminister through an I.V. line containing an in-line filter (pore size 15 micron) using an infusion pump. Do not mix with other infusions; do not use if turbid. Begin infusion within 6 hours of entering vial, complete infusion within 12 hours.

Infuse at 15 mg/kg/hour. If no adverse reactions occur within 30 minutes, may increase rate to 30 mg/kg/hour. If no adverse reactions occur within the second 30 minutes, may increase rate to 60 mg/kg/hour; maximum rate of infusion: 75 mL/hour. When infusing subsequent doses, may decrease titration interval from 30 minutes to 15 minutes. If patient develops nausea, back pain, or flushing during infusion, slow the rate or temporarily stop the infusion. Discontinue if blood pressure drops or in case of anaphylactic reaction.

Dietary Considerations

CytoGam® solution for injection 50 mg (± 10 mg/mL) contains sodium 20-30 mEq/L

StorageStore between 2°C and 8°C (35.6°F and 46.4°F). Use reconstituted product within 6 hours.
ReconstitutionDo not admix with other medications; do not use if turbid. Do not shake vials. Dilution is not recommended.
CompatibilityInfusion with other products is not recommended. If unavoidable, may be piggybacked into an I.V. line of sodium chloride, 2.5% dextrose in water, 5% dextrose in water, 10% dextrose in water, or 20% dextrose in water. Do not dilute more than 1:2. Do not admix with other medications.
ContraindicationsHypersensitivity to CMV-IGIV, other immunoglobulins, or any component of the formulation; immunoglobulin A deficiency
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available.

- Aseptic meningitis: Aseptic meningitis syndrome (AMS) has been reported with intravenous immune globulin administration (rare); may occur with high doses (≥2 g/kg).

- Hemolysis: Intravenous immune globulin has been associated with antiglobulin hemolysis; monitor for signs of hemolytic anemia.

- Pulmonary edema: Monitor for transfusion-related acute lung injury (TRALI); noncardiogenic pulmonary edema has been reported with intravenous immune globulin use.

- Renal impairment: Acute renal dysfunction (increased serum creatinine, oliguria, acute renal failure) can rarely occur; usually within 7 days of use (more likely with products stabilized with sucrose). Use with caution in the elderly, patients with renal disease, diabetes mellitus, volume depletion, sepsis, paraproteinemia, and nephrotoxic medications due to risk of renal dysfunction. In patients at risk of renal dysfunction, the rate of infusion and concentration of solution should be minimized. discontinue if renal function deteriorates.

- Thrombotic events: Thrombotic events have been reported with administration of intravenous immune globulin; use with caution in patients with cardiovascular risk factors.

Disease-related concerns:

- Hypovolemia: Patients should not be volume depleted prior to therapy.

Special populations:

- Elderly: Use with caution in patients >65 years of age.

Dosage form specific issues:

- Albumin: Product is stabilized with albumin.

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

- Sucrose: Product is stabilized with sucrose.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown
Adverse Reactions

<6%:

Cardiovascular: Flushing

Central nervous system: Chills, fever

Gastrointestinal: Nausea, vomiting

Neuromuscular & skeletal: Arthralgia, back pain, muscle cramps

Respiratory: Wheezing

<1%: Blood pressure decreased

Postmarketing and/or case reports: Acute renal failure, acute tubular necrosis, anaphylactic shock, angioneurotic edema, anuria, aseptic meningitis syndrome (AMS), BUN increased, oliguria, osmotic nephrosis, proximal tubular nephropathy, serum creatinine increased

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Monitoring ParametersVital signs (throughout infusion), flushing, chills, muscle cramps, back pain, fever, nausea, vomiting, wheezing, decreased blood pressure, or anaphylaxis; renal function and urine output
Nursing: Physical Assessment/MonitoringAssess for history of previous allergic reactions. Monitor vital signs during infusion and observe for adverse or allergic reactions. Teach patient adverse symptoms to report.
Patient EducationThis medication can only be administered by infusion. You will be monitored closely during the infusion. If you experience nausea, ask for assistance; do not get up alone. Do not have any vaccinations for the next 3 months without consulting prescriber. Immediately report chills, muscle cramping, low back pain, chest pain or tightness, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

CytoGam®: 50 mg ± 10 mg/mL (50 mL) [contains sodium 20-30 mEq/L, human albumin, and sucrose]

Generic AvailableNo
ManufacturerMassachusetts Public Health Biologic Laboratories/MedImmune, Inc
Mechanism of ActionCMV-IGIV is a preparation of immunoglobulin G derived from pooled healthy blood donors with a high titer of CMV

antibodies; administration provides a passive source of antibodies against cytomegalovirus

Dabigatran Etexilate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(da BIG a tran ett EX ill ate)

Canadian Brand NamesPradax™

Pharmacologic CategoryAnticoagulant, Thrombin Inhibitor

Use: Labeled IndicationsPostoperative thromboprophylaxis in patients who have undergone total hip or knee replacement procedures

Use: Unlabeled/Investigational**Investigational:** Prevention of stroke and systemic embolism in patients with nonvalvular atrial fibrillation

Dosing: Adults**Note:** Therapy should not be initiated until hemostasis has been established. When transitioning from intravenous anticoagulation therapy, initiate oral dabigatran therapy no sooner than time of next regularly scheduled dose of I.V. anticoagulant. When transitioning from dabigatran to I.V. anticoagulation therapy, allow 24 hours after the last dabigatran dose before initiating I.V. anticoagulation therapy.

Postoperative thromboprophylaxis: Oral:

Knee replacement: Initial: 110 mg given 1-4 hours after completion of surgery and establishment of hemostasis **OR** 220 mg as one dose in postoperative patients in whom therapy is not initiated on day of surgery regardless of reason; maintenance: 220 mg once daily (total duration of therapy: 10 days)

Hip replacement: Initial: 110 mg given 1-4 hours after completion of surgery and establishment of hemostasis **OR** 220 mg as one dose in postoperative patients in whom therapy is not initiated on day of surgery regardless of reason; maintenance: 220 mg once daily (total duration of therapy: 28-35 days)

Dosing: Elderly**Postoperative thromboprophylaxis:** Patients >75 years: Oral: Refer to adult dosing. Dosage reduction to 150 mg/day is suggested by the manufacturer. **Note:** Therapy should not be initiated until hemostasis has been established.

Dosing: Renal Impairment

Moderate renal impairment (Cl_{cr} 30-50 mL/minute): Initial: 75 mg given 1-4 hours after completion of surgery and establishment of hemostasis; maintenance: 150 mg/day.

Severe renal impairment (Cl_{cr} < 30 mL/minute): Use is contraindicated.

Dosing: Hepatic Impairment

Mild hepatic impairment: Manufacturer provides no specific recommendations.

Moderate-to-severe hepatic impairment: Use not recommended.

Administration: OralAdminister with water. May be taken without regard to meals.

Dietary ConsiderationsMay be taken without regard to meals.

Storage

Blister: Store between 15°C to 25°C (59°F to 77°F). Protect from moisture.

Bottle: Store between 15°C to 30°C (59°F to 86°F). Protect from moisture; discard 30 days after opening container.

RestrictionsNot available in the U.S.

ContraindicationsHypersensitivity to dabigatran or any component of the formulation; severe renal impairment (Cl_{cr} <30 mL/minute); hemorrhagic manifestations, bleeding diathesis, or patients with spontaneous or pharmacological hemostatic impairment; lesions at risk of clinically significant bleeding (eg, hemorrhagic or ischemic cerebral infarction) within previous 6 months; concomitant therapy with strong P-glycoprotein (Pgp) inhibitors such as quinidine

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: The most common complication is bleeding. Certain patients are at increased risk of bleeding; risk factors include bacterial endocarditis, congenital or acquired bleeding disorders, thrombocytopenia, recent puncture of large vessels or organ biopsy, stroke, intracerebral surgery, or other neuraxial procedure, severe uncontrolled hypertension, renal impairment, recent major surgery, recent major bleeding (intracranial, GI, intraocular, or pulmonary). Monitor for signs and symptoms of bleeding. Avoid use in patients undergoing anesthesia with postoperative indwelling epidural catheters. Hematomas (spinal or epidural) resulting in extended or permanent paralysis may occur. Prior to perispinal procedures, initiate dabigatran therapy only after establishing hemostasis and no sooner than 2 hours after catheter puncture or removal.

Disease-related concerns:

- Hepatic impairment: Use in patients with moderate or severe hepatic impairment (Child-Pugh class B or C) or with elevated hepatic transaminases >2 times the upper limit of normal (ULN) has not been studied. Avoid use in these patients.

- Renal impairment: Use is contraindicated in severe renal impairment (Cl_{cr} <30 mL/minute). Dose reductions are required in patients with moderate impairment (Cl_{cr} 30-50 mL/minute. Discontinue therapy in patients who develop acute renal failure. Evaluate renal function prior to and during therapy.

Concurrent drug therapy issues:

- Anticoagulants: Due to an increased risk of bleeding, avoid use with other direct thrombin inhibitors (eg, bivalirudin), unfractionated heparin or heparin derivatives, low molecular weight heparins (eg, enoxaparin), thienopyridines (eg, clopidogrel, ticlodipine), GPIIb/IIIa antagonists (eg, eptifibatide), aspirin, coumarin derivatives, and sulfinpyrazone. NSAIDs should be used cautiously. Appropriate doses of unfractionated heparin may be used to maintain catheter patency.

Special populations:

- Elderly: Use with caution in patients >75 years of age; dose reductions may be indicated.

- Patients <50 kg: Use with caution in this patient population. Dabigatran exposure is ~25% higher in patients with a body weight of ~48 kg.

- Pediatrics: Safety and efficacy have not been established in patients <18 years of age.

Pregnancy Considerations

Adverse events were observed in some animal reproductive studies. There are no adequate and well-controlled studies in pregnant women. Dabigatran etexilate should be used in pregnant women only if clinical benefit outweighs risks of therapy.

Lactation

Excretion in breast milk unknown/not recommended

Adverse Reactions

>10%: Hematologic: Bleeding (8% to 14%; major: ≤2%)

1% to 10%:

Gastrointestinal: GI hemorrhage (≤1%)

Hematologic: Anemia (1% to 4%), hematoma (1% to 2%), hemoglobin decreased (1% to 2%), hemorrhage (postprocedural or wound: 1% to 2%)

Hepatic: ALT increased (≥3 x ULN: 2% to 3%)

Renal: Hematuria (1%)

Miscellaneous: Wound secretion (5%), postprocedural discharge (1%)

<1%, postmarketing, and/or case reports: AST increased, bloody discharge, ecchymosis, epistaxis, hemarthrosis, hematocrit decreased; hemorrhage (catheter site, hemorrhoidal, incision site, rectal); hepatic function abnormal, occult blood positive, thrombocytopenia

Drug Interactions

Amiodarone: May increase the serum concentration of Dabigatran Etexilate. *Risk D: Consider therapy modification*

Antacids: May decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Atorvastatin: May decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Proton Pump Inhibitors: May decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

QuiNIDine: May increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Food has no affect on the bioavailability of dabigatran, but delays the time to peak plasma concentrations by 2 hours.

Herb/Nutraceutical: St John's wort may decrease levels/effects of dabigatran (concomitant use is not recommended). Concomitant use of dabigatran with herbs possessing anticoagulant/antiplatelet properties may increase the risk for bleeding.

Monitoring ParametersActivated partial thromboplastin time (aPTT) (values >2.5 x control may indicate overanticoagulation), ecarin clotting test (ECT) if available, thrombin time (TT), CBC with differential, renal function

Nursing: Physical Assessment/MonitoringUse caution with any condition that increases risk of bleeding. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (especially any agents that may affect coagulation). Assess results of laboratory tests, patient response, and adverse reactions (bleeding) on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions (bleeding precautions), and adverse symptoms to report.

Monitoring: Lab TestsActivated partial thromboplastin time (aPTT) (values >2.5 x control may indicate overanticoagulation), ecarin clotting test (ECT) if available, thrombin time (TT), CBC with differential, renal function

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber (including aspirin or other pain medications). Consult prescriber for appropriate pain medication if in pain. Take as directed; do not skip dose or take more than instructed. May be swallowed with water. Store medication as directed; protect from moisture. You may have a tendency to bleed easily while taking this medication (brush teeth with soft brush, use waxed dental floss, use electric razor, avoid scissors or sharp knives, avoid potentially harmful activities). Report any signs of unusual bleeding or bruising (bleeding gums, nosebleed, blood in urine, dark stool, bruises) or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or if you are breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule:

Pradax™ [CAN]: 75 mg, 110 mg [not available in the U.S.]

ManufacturerBoehringer Ingelheim Canada Ltd

Mechanism of ActionProdrug lacking anticoagulant activity that is converted *in vivo* to the active dabigatran, a specific, reversible, direct thrombin inhibitor that inhibits both free and fibrin-bound thrombin. Inhibits coagulation by preventing thrombin-mediated effects, including cleavage of fibrinogen to fibrin monomers, activation of factors V, VIII, XI and XIII, and inhibition of thrombin-induced platelet aggregation.

Pharmacodynamics/Kinetics

Absorption: Rapid; initially slow postoperatively

Distribution: V_d: 60-70 L

Protein binding: 34% to 35% (concentration independent)

Metabolism: Hepatic; dabigatran etexilate is rapidly and completely hydrolyzed to dabigatran (active form) by plasma and hepatic esterases; dabigatran undergoes hepatic glucuronidation to active acylglucuronide isomers

Bioavailability: ~6.5%

Half-life elimination: 11 hours; elderly 14-17 hours

Time to peak, plasma: Dabigatran: 0.5-2 hours; delayed 2 hours by food

Excretion: Urine (85%, primarily as unchanged drug); fecal (6% of total dose)

Dental Health: Effects on Dental TreatmentDabigatran etexilate is converted *in vivo* to the active dabigatran, a specific, reversible, direct thrombin inhibitor. It causes bleeding by preventing thrombin-mediated effects, and by inhibiting thrombin-induced platelet aggregation.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentSt John's wort may decrease levels/effects of dabigatran (concomitant use is not recommended)

Index TermsDabigatran Etexilate Mesilate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Dacarbazine may be confused with Dicarbosil®, procarbazine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(da KAR ba zeen)

Canadian Brand NamesDTIC®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent (Triazene)

Use: Labeled IndicationsTreatment of malignant melanoma, Hodgkin's disease, soft-tissue sarcomas, fibrosarcomas, rhabdomyosarcoma, islet cell carcinoma, medullary carcinoma of the thyroid, and neuroblastoma

Dosing: AdultsRefer to individual protocols. Some dosage regimens include:

Intra-arterial: 50-400 mg/m^2 for 5-10 days

Hodgkin's disease, ABVD: 375 mg/m^2 days 1 and 15 every 4 weeks **or** 100 mg/m^2/day for 5 days

Metastatic melanoma (alone or in combination with other agents): I.V.: 150-250 mg/m^2 days 1-5 every 3-4 weeks

Metastatic melanoma: I.V.: 850 mg/m^2 every 3 weeks

High dose: Bone marrow/blood cell transplantation: I.V.: 1-3 g/m^2; maximum dose as a single agent: 3.38 g/m^2; generally combined with other high-dose chemotherapeutic drugs

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols.

Pediatric solid tumors: I.V.: 200-470 mg/m^2/day over 5 days every 21-28 days

Pediatric neuroblastoma: I.V.: 800-900 mg/m^2 as a single dose on day 1 of therapy every 3-4 weeks in combination therapy

Hodgkin's disease, ABVD: I.V.: 375 mg/m^2 on days 1 and 15 of treatment course, repeat every 28 days

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain dosage adjustment guidelines. The following guidelines have been used by some clinicians (Kintzel, 1995):

Cl$_{cr}$ 46-60 mL/minute: Administer 80% of dose

Cl$_{cr}$ 31-45 mL/minute: Administer 75% of dose

Cl$_{cr}$ <30 mL/minute: Administer 70% of dose

Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain adjustment guidelines. May cause hepatotoxicity; monitor closely for signs of toxicity.

Dosing: Combination Regimens

Brain tumors: 8 in 1 (Brain Tumors)

Lymphoma, Hodgkin's:

ABVD

MOPP/ABVD

Melanoma:

BOLD

BOLD (Melanoma)

BOLD + Interferon

Cisplatin-Dacarbazine-Carmustine (Melanoma)

Cisplatin-Dacarbazine-Interferon Alfa-2b-Aldesleukin

Cisplatin-Vinblastine-Dacarbazine (Melanoma)

Dartmouth Regimen

IL-2 + IFN

Neuroblastoma: CCDDT (Neuroblastoma)

Sarcoma: CYVADIC

Soft tissue sarcoma:

AD

MAID

Oncology: Bone Marrow - High DoseI.V.: 1-3 g/m^2; maximum dose as a single agent: 3.38 g/m^2; generally combined with other high-dose chemotherapeutic drugs.

Calculations

- Body Surface Area: Adults

Administration: I.V.Irritant. Infuse over 30-60 minutes.

Administration: I.V. DetailRapid infusion may cause severe venous irritation.

Extravasation management: Local pain, burning sensation, and irritation at the injection site may be relieved by local application of hot packs. If extravasation occurs, apply cold packs. Protect exposed tissue from light following extravasation.

BMT only: Doses of 6591 mg/m^2 have been administered, although hypotension is considered the nonhematologic dose-limiting side effect for doses >3380 mg/m^2. Infusion-related hypotension may be secondary to calcium chelation by citric acid in formulation.

pH: 3-4

StorageStore intact vials under refrigeration (2°C to 8°C) and protect from light. Vials are stable for 4 weeks at room temperature. Reconstituted solution is stable for 24 hours at room temperature (20°C) and 96 hours under refrigeration (4°C). Solutions for infusion (in D_5W or NS) are stable for 24 hours at room temperature and protected from light. Decomposed drug turns pink.

ReconstitutionThe manufacturer recommends reconstituting 100 mg and 200 mg vials with 9.9 mL and 19.7 mL SWFI, respectively, to a concentration of 10 mg/mL; some institutions use different standard dilutions (eg, 20 mg/mL).

Standard I.V. dilution: Dilute in 250-1000 mL D_5W or NS.

CompatibilityStable in NS, sterile water for injection; **variable stability (consult detailed reference)** in D_5W.

Y-site administration: Compatible: Amifostine, aztreonam, etoposide phosphate, filgrastim, fludarabine, granisetron, melphalan, ondansetron, paclitaxel, sargramostim, teniposide, thiotepa, vinorelbine. **Incompatible:** Allopurinol, cefepime, piperacillin/tazobactam. **Variable (consult detailed reference):** Heparin.

Compatibility when admixed: Compatible: Bleomycin, carmustine, cyclophosphamide, cytarabine, dactinomycin, doxorubicin, fluorouracil, hydrocortisone sodium phosphate, lidocaine, mercaptopurine, methotrexate, ondansetron, vinblastine. **Incompatible:** Hydrocortisone sodium succinate. **Variable (consult detailed reference):** Ondansetron with doxorubicin.

ContraindicationsHypersensitivity to dacarbazine or any component of the formulation

Allergy Considerations

- Dacarbazine (DTIC)/Temozolomide Allergy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Carcinogenic/teratogenic: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hepatic effects: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Anaphylaxis: May occur.

- Bone marrow suppression: **[U.S. Boxed Warning]: Bone marrow suppression is a common toxicity;** monitor closely.
- Carcinogenic/teratogenic: **[U.S. Boxed Warning]: May be carcinogenic and/or teratogenic.**
- Extravasation: May result in tissue damage and pain.
- Hepatic effects: **[U.S. Boxed Warning]: Hepatotoxicity with hepatocellular necrosis and hepatic vein thrombosis has been reported,** usually with combination chemotherapy, but may occur with dacarbazine alone.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; half-life is increased, monitor for toxicity and consider dosage reduction.
- Renal impairment: Use with caution in patients with renal impairment; half-life is increased, monitor for toxicity and consider dosage reduction.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorC
Pregnancy Considerations**[U.S. Boxed Warning]: This agent is carcinogenic and/or teratogenic when used in animals.**
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Gastrointestinal: Nausea and vomiting (>90%), can be severe and dose limiting; nausea and vomiting decrease on successive days when dacarbazine is given daily for 5 days; diarrhea

Hematologic: Myelosuppression, leukopenia, thrombocytopenia - dose limiting

Onset: 5-7 days

Nadir: 7-10 days

Recovery: 21-28 days

Local: Pain on infusion, may be minimized by administration through a central line, or by administration as a short infusion (eg, 1-2 hours as opposed to bolus injection)

1% to 10%:

Dermatologic: Alopecia, rash, photosensitivity

Gastrointestinal: Anorexia, metallic taste

Miscellaneous: Flu-like syndrome (fever, myalgia, malaise)

<1%: Anaphylactic reactions, diarrhea (following high-dose bolus injection), eosinophilia, headache, hepatic necrosis, hepatic vein occlusion, liver enzymes increased (transient), paresthesia

Oncology: VesicantNo; irritant
Oncology: Emetic PotentialHigh (>90%)
Oncology: Bone Marrow - Unique Toxicity

Cardiovascular: Hypotension (infusion-related)

Gastrointestinal: Severe nausea and vomiting

Metabolism/Transport Effects**Substrate** (major) of CYP1A2, 2E1
Drug Interactions

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2E1 Inhibitors (Moderate): May decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP2E1 Inhibitors (Strong): May decrease the metabolism of CYP2E1 Substrates. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Sorafenib: May decrease the serum concentration of Dacarbazine. Sorafenib may also increase the concentration of dacarbazine's active metabolite. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to GI irritation).

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization).

Monitoring ParametersCBC with differential, liver function

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions. Premedicate with antiemetic (emetic potential is moderately high). Infusion site must be closely monitored; extravasation can cause severe cellulitis or tissue necrosis. Assess results of laboratory tests (CBC with differential, LFTs), therapeutic effectiveness, and adverse response prior to each treatment and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, liver function

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. This drug can only be given by infusion. Report immediately any pain, burning, or swelling at infusion site. Limit oral intake for 4-6 hours before infusion. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea, vomiting, loss of appetite, or diarrhea (consult prescriber for medication); hair loss (reversible); or headache, fever, sinus congestion, or muscles aches (consult prescriber for analgesic). Report immediately any numbness in extremities or change in gait, respiratory distress or respiratory difficulty; rash; easy bruising or bleeding; yellowing of eyes or skin, change in color of urine or blackened stool; or any other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 100 mg, 200 mg

Generic AvailableYes

Mechanism of ActionAlkylating agent which appears to form methylcarbonium ions that attack nucleophilic groups in DNA; cross-links strands of DNA resulting in the inhibition of DNA, RNA, and protein synthesis, the exact mechanism of action is still unclear.

Pharmacodynamics/Kinetics

Onset of action: I.V.: 18-24 days

Distribution: V_d: 0.6 L/kg, exceeding total body water; suggesting binding to some tissue (probably liver)

Protein binding: 5%

Metabolism: Extensively hepatic; hepatobiliary excretion is probably of some importance; metabolites may also have an antineoplastic effect

Half-life elimination: Biphasic: Initial: 20-40 minutes; Terminal: 5 hours

Excretion: Urine (~30% to 50% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause headache

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

Oncology: Bone Marrow CommentsDoses of 6591 mg/m^2 have been administered, although hypotension is considered the nonhematologic dose-limiting side effect for doses >3380 mg/m^2. Infusion-related hypotension may be secondary to calcium chelation by citric acid in formulation.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(dac KLYE zue mab)

U.S. Brand NamesZenapax®

Canadian Brand NamesZenapax®

Pharmacologic CategoryImmunosuppressant Agent

Use: Labeled IndicationsPart of an immunosuppressive regimen (including cyclosporine and corticosteroids) for the prophylaxis of acute organ rejection in patients receiving renal transplant

Use: Unlabeled/InvestigationalGraft-versus-host disease; prevention of organ rejection after heart transplant

Dosing: Adults

Note: Daclizumab is used adjunctively with other immunosuppressants (eg, cyclosporine, corticosteroids, mycophenolate mofetil, and azathioprine).

Immunoprophylaxis against acute renal allograft rejection: I.V.: 1 mg/kg infused over 15 minutes within 24 hours before transplantation (day 0), then every 14 days for 4 additional doses

Treatment of graft-versus-host disease (unlabeled use, limited data): I.V.: 0.5-1.5 mg/kg, repeat same dosage for transient response. Repeat doses have been administered 11-48 days following the initial dose.

Prevention of organ rejection after heart transplant (unlabeled use): 1 mg/kg up to a maximum of 100 mg; administer within 12 hours after heart transplant and on days 8, 22, 36, and 50 post-transplant

Dosing: ElderlyRefer to adult dosing. Use with caution.

Dosing: PediatricRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment needed.

Dosing: Hepatic ImpairmentNo data available for patients with severe impairment.

Administration: I.V.For I.V. administration following dilution. Daclizumab solution should be administered within 4 hours of preparation if stored at room temperature; infuse over a 15-minute period via a peripheral or central vein.

StorageRefrigerate vials at 2°C to 8°C (36°F to 46°F). Do not shake or freeze; protect undiluted solution against direct sunlight. Diluted solution is stable for 24 hours at 4°C or for 4 hours at room temperature.

ReconstitutionDose should be further diluted in 50 mL 0.9% sodium chloride solution. When mixing, gently invert bag to avoid foaming; do not shake. Do not use if solution is discolored.

CompatibilityDo not mix with other medications or infuse other medications through same I.V. line.

ContraindicationsHypersensitivity to daclizumab or any component of the formulation

Allergy Considerations

- Daclizumab Allergy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Severe hypersensitivity reactions have been rarely reported; anaphylaxis has been observed on initial exposure and following re-exposure; medications for the management of severe allergic reaction should be available for immediate use. Anti-idiotype antibodies have been measured in patients who have received daclizumab (adults 14%; children 34%); detection of antibodies may be influenced by multiple factors and may therefore be misleading.

- Infections: Patients on immunosuppressive therapy are at increased risk for infectious complications; long-term effects on immune function are unknown.

- Secondary malignancy: Patients on immunosuppressive therapy are at increased risk for secondary malignancies; long-term effects on immune function are unknown.

Special populations:

- Cardiac transplant patients: The combined use of daclizumab, cyclosporine, mycophenolate mofetil, and corticosteroids has been associated with an increased mortality in cardiac transplant patients. Higher mortality may be associated with the use of antilymphocyte globulin and a higher incidence of severe infections.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of a physician experienced in immunosuppressive therapy.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Generally, IgG molecules cross the placenta. Do not use during pregnancy unless the potential benefit to the mother outweighs the possible risk to the fetus. Women of childbearing potential should use effective contraception before, during, and for 4 months following treatment.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAlthough reported adverse events are frequent, when daclizumab is compared with placebo the incidence of adverse effects is similar between the two groups. Many of the adverse effects reported during clinical trial use of daclizumab may be related to the patient population, transplant procedure, and concurrent transplant medications. Diarrhea, fever, postoperative pain, pruritus, respiratory tract infection, urinary tract infection, and vomiting occurred more often in children than adults.

≥5%:

Cardiovascular: Chest pain, edema, hyper-/hypotension, tachycardia, thrombosis

Central nervous system: Dizziness, fatigue, fever, headache, insomnia, pain, post-traumatic pain, tremor

Dermatologic: Acne, cellulitis, wound healing impaired

Gastrointestinal: Abdominal distention, abdominal pain, constipation, diarrhea, dyspepsia, epigastric pain, nausea, pyrosis, vomiting

Genitourinary: Dysuria

Hematologic: Bleeding

Neuromuscular & skeletal: Back pain, musculoskeletal pain

Renal: Oliguria, renal tubular necrosis

Respiratory: Cough, dyspnea, pulmonary edema

Miscellaneous: Lymphocele, wound infection

≥2% to <5%:

Central nervous system: Anxiety, depression, shivering

Dermatologic: Hirsutism, pruritus, rash

Endocrine & metabolic: Dehydration, diabetes mellitus, fluid overload

Gastrointestinal: Flatulence, gastritis, hemorrhoids

Genitourinary: Urinary retention, urinary tract bleeding

Local: Application site reaction

Neuromuscular & skeletal: Arthralgia, leg cramps, myalgia, weakness

Ocular: Vision blurred

Renal: Hydronephrosis, renal damage, renal insufficiency

Respiratory: Atelectasis, congestion, hypoxia, pharyngitis, pleural effusion, rales, rhinitis

Miscellaneous: Night sweats, prickly sensation, diaphoresis

<1%, postmarketing, and/or case reports: Severe hypersensitivity reactions (rare): Anaphylaxis, bronchospasm, cardiac arrest, cytokine release syndrome, hypotension, laryngeal edema, pulmonary edema, pruritus, urticaria

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess cardiorespiratory and renal function (fluid overload) and adverse reactions during infusion and periodically between infusions. Be alert to the possibility of the development of infection or malignancies. **Note:** Hypersensitivity reactions can occur;

medications for immediate treatment of severe allergic reactions should be available for immediate use. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationThis medication, which may help transplant rejection, can only be administered by infusion. You will be monitored closely during infusion. Report immediately any respiratory or swallowing difficulty; tightness in jaw or throat; chest pain; or rash, pain, burning, redness, or swelling at infusion site. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and nutrition (small frequent meals may be advisable). May cause headache, dizziness, fatigue (use caution when driving or engaging in tasks that require alertness until response to drug is known): back pain, leg cramps, or musculoskeletal pain (consult prescriber for approved analgesic); or nausea, vomiting, dyspepsia, or abdominal discomfort (good mouth care, small frequent meals, chewing gum, or sucking lozenges may help). Report changes in urinary pattern; unusual bleeding or bruising; chest pain or palpitations; persistent dizziness, tremors, or headache; respiratory difficulty or unusual cough; rash; opportunistic infection (vaginal itching or drainage, sores in mouth, unusual fever or chills); or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [concentrate; preservative free]:

Zenapax®: 5 mg/mL (5 mL) [contains polysorbate 80]

Generic AvailableNo

ManufacturerRoche Laboratories Inc

Mechanism of ActionDaclizumab is a chimeric (90% human, 10% murine) monoclonal IgG antibody produced by recombinant DNA technology. Daclizumab inhibits immune reactions by binding and blocking the alpha-chain of the interleukin-2 receptor (CD25) located on the surface of activated lymphocytes.

Pharmacodynamics/Kinetics

Distribution: V_d:

Adults: Central compartment: 0.031 L/kg; Peripheral compartment: 0.043 L/kg

Children: Central compartment: 0.067 L/kg; Peripheral compartment: 0.047 L/kg

Half-life elimination (estimated): Adults: Terminal: 20 days; Children: 13 days

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, anxiety, or insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsA recent international, multicenter trial was published evaluating the use of daclizumab vs placebo with cyclosporine, mycophenolate, and corticosteroids in heart transplant recipients. The primary endpoint was a composite of moderate-severe cellular rejection, hemodynamically significant graft dysfunction, a second transplant, or death. At 6 months, a significantly smaller number of patients in the daclizumab group reached the endpoint when compared to the placebo group (36% vs 48%, $p = 0.007$). Although cytolytic therapy was excluded from the study, 40 patients in the daclizumab arm and 37 patients in the placebo arm received either muromonab-CB3, antithymocyte globulin, or antilymphocyte globulin. Cytolytic therapy was administered because of its renal-sparing properties or for acute rejection in most cases. Six patients in the daclizumab arm who received concurrent cytolytic therapy died from sepsis. No one in the placebo group who received cytolytic therapy died from sepsis. Daclizumab was efficacious as prophylaxis against acute cellular rejection after cardiac transplant. Concurrent or anticipated use of cytolytic therapy with daclizumab should be avoided.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

DACTINomycin may be confused with DAPTOmycin, DAUNOrubicin

Actinomycin may be confused with achromycin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(dak ti noe MYE sin)

U.S. Brand NamesCosmegen®

Canadian Brand NamesCosmegen®

Pharmacologic CategoryAntineoplastic Agent, Antibiotic

Use: Labeled IndicationsTreatment of testicular tumors, melanoma, gestational trophoblastic neoplasm, Wilms' tumor, neuroblastoma, retinoblastoma, rhabdomyosarcoma, uterine sarcomas, Ewing's sarcoma, Kaposi's sarcoma, sarcoma botryoides, and soft tissue sarcoma

Dosing: AdultsRefer to individual protocols.

Note: Medication orders for dactinomycin are commonly written in MICROgrams (eg, 150 mcg) although many regimens list the dose in MILLIgrams (eg, mg/kg or mg/m^2). One-time doses for >1000 mcg, or multiple-day doses for >500 mcg/day are not common. The dose intensity per 2-week cycle for adults and children should not exceed 15 mcg/kg/day for 5 days or 400-600 mcg/m^2/day for 5 days. Some practitioners recommend calculation of the dosage for obese or edematous adult patients on the basis of body surface area in an effort to relate dosage to lean body mass.

Usual doses:

2.5 mg/m^2 in divided doses over 1 week, repeated every 2 weeks **or**

0.75-2 mg/m^2 every 1-4 weeks **or**

400-600 mcg/m^2/day for 5 days, repeated every 3-6 weeks

Testicular cancer: 1000 mcg/m^2 on day 1 (as part of a combination chemotherapy regimen)

Gestational trophoblastic neoplasm: 12 mcg/kg/day for 5 days **or** 500 mcg days 1 and 2 (as part of a combination chemotherapy regimen)

Wilms' tumor, Ewing's sarcoma: 15 mcg/kg/day for 5 days (in various combination regimens and schedules)

Dosing: ElderlyRefer to adult dosing. Elderly patients are at increased risk of myelosuppression; dosing should begin at the low end of the dosing range.

Dosing: PediatricRefer to individual protocols.

Note: Dactinomycin doses are almost ALWAYS expressed in MICROGRAMS rather than milligrams. The dose intensity per 2-week cycle for adults and children should not exceed 15 mcg/kg/day for 5 days or 400-600 mcg/m^2/day for 5 days.

Usual dose: I.V.: Children >6 months: 15 mcg/kg/day **or** 400-600 mcg/m^2/day for 5 days every 3-6 weeks

Wilms' tumor, rhabdomyosarcoma, Ewing's sarcoma: I.V.: Children >6 months: 15 mcg/kg/day for 5 days (in various combination regimens and schedules)

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Combination Regimens

Gestational trophoblastic tumor:

CHAMOCA (Modified Bagshawe Regimen)

CHAMOMA (Bagshawe Regimen)

EMA/CO

EP/EMA

Osteosarcoma: POG-8651

Retinoblastoma: VAC (Retinoblastoma)

Rhabdomyosarcoma:

VAC Pulse

VAC (Rhabdomyosarcoma)

Sarcoma: VAC Alternating With IE (Ewing's Sarcoma)

Wilms' tumor:

AAV (DD)

ACAV (J)

AV (EE)

AV (K)

AV (L)

AV (Wilms' Tumor)

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Slow I.V. push or infuse over 10-15 minutes. Avoid extravasation. Do not administer I.M. or SubQ. Do not filter with cellulose ester membrane filters.
Administration: I.V. DetailpH: 5.5-7.0 (reconstituted solution)
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light and humidity. Solutions in 50 mL D_5W or NS are stable for 24 hours at room temperature.
ReconstitutionDilute with 1.1 mL of preservative-free SWI to yield a final concentration of 500 mcg/mL. Do not use preservative diluent as precipitation may occur. Cellulose ester membrane filters should not be used during preparation.
CompatibilityStable in D_5W, NS, SWFI.

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cefepime, etoposide phosphate, fludarabine, gemcitabine, granisetron, melphalan, ondansetron, sargramostim, teniposide, thiotepa, vinorelbine. **Incompatible:** Filgrastim.

Compatibility when admixed: Compatible: Dacarbazine.

ContraindicationsHypersensitivity to dactinomycin or any component of the formulation; patients with concurrent or recent chickenpox or herpes zoster; avoid in infants <6 months of age
Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Hazardous agent: See “Special handling” below.
- Pregnancy: See “Special populations” below.
- Skin irritation/extravasation: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: **[U.S. Boxed Warning]: Avoid inhalation of vapors or contact with skin, mucous membrane, or eyes; use appropriate precautions for handling and disposal.**

Concerns related to adverse effects:

- Secondary malignancies: Long-term observation of cancer survivors is recommended due to the potential for secondary primary tumors following treatment with radiation and antineoplastic agents.
- Skin irritation/extravasation: **[U.S. Boxed Warning]: Extremely irritating to tissues and must be administered I.V.; if extravasation occurs during I.V. use, severe damage to soft tissues will occur.**
- Toxic effects: May be delayed in onset (2-4 days following a course of treatment) and may require 1-2 weeks to reach maximum severity.
- Veno-occlusive disease: May cause veno-occlusive liver disease, increased risk in children <4 years of age; use with caution in hepatobiliary dysfunction.

Special populations:

- Pregnancy: **[U.S. Boxed Warning]: Avoid exposure during pregnancy.**

- Radiation therapy recipients: Potentiates the effects of radiation therapy; use with caution in patients who have received radiation therapy; reduce dosages in patients who are receiving dactinomycin and radiation therapy simultaneously; combination with radiation therapy may result in increased GI toxicity and myelosuppression. Avoid dactinomycin use within 2 months of radiation treatment for right-sided Wilms' tumor, may increase the risk of hepatotoxicity.

Other warnings/precautions:

- Dosage expression: Dosage is usually expressed in **MICRO**grams, **NOT** milligrams, and must be calculated on the basis of body surface area (BSA) in obese or edematous adult patients.

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

- Vaccines: Avoid administration of live vaccines.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenic effects and fetal loss There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential are advised not to become pregnant. Use only when potential benefit justifies potential risk to the fetus. **[U.S. Boxed Warning]: Avoid exposure during pregnancy.**

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if dactinomycin is excreted in human breast milk. Due to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse ReactionsFrequency not defined.

Central nervous system: Fatigue, fever, lethargy, malaise

Dermatologic: Acne, alopecia (reversible), cheilitis; increased pigmentation, sloughing, or erythema of previously irradiated skin; skin eruptions

Endocrine & metabolic: Growth retardation, hypocalcemia

Gastrointestinal: Abdominal pain, anorexia, diarrhea, dysphagia, esophagitis, GI ulceration, mucositis, nausea, pharyngitis, proctitis, stomatitis, vomiting

Hematologic: Agranulocytosis, anemia, aplastic anemia, leukopenia, pancytopenia, reticulocytopenia, thrombocytopenia, myelosuppression (onset: 7 days, nadir: 14-21 days, recovery: 21-28 days)

Hepatic: Ascites, hepatic failure, hepatitis, hepatomegaly, hepatotoxicity, liver function test abnormality, veno-occlusive disease

Local: Erythema, edema, epidermolysis, pain, tissue necrosis, and ulceration (following extravasation)

Neuromuscular & skeletal: Myalgia

Renal: Renal function abnormality

Respiratory: Pneumonitis

Miscellaneous: Anaphylactoid reaction, infection

Oncology: VesicantYes; see Management of Drug Extravasations.

Oncology: Emetic PotentialHigh (60% to 90%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Test InteractionsMay interfere with bioassays of antibacterial drug levels

Monitoring ParametersCBC with differential and platelet count, liver function tests, and renal function tests

Nursing: Physical Assessment/MonitoringPatient must be monitored closely during infusion; extravasation is extremely damaging to soft tissue and will cause a severe local reaction. Administer slow I.V. push over 10-15 minutes. Do not give I.M. or SubQ. Assess results of laboratory tests (eg, hematological, renal, and hepatic function), therapeutic response, and adverse reactions (myelosuppression, nausea, vomiting, glossitis, and oral ulceration) prior to each treatment and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count, liver and renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be given by infusion; report immediately any pain, burning, or swelling at infusion site; sudden chest pain; difficulty breathing or swallowing; or chills. Limit oral intake for 4-6 hours immediately before infusion. Between infusions, maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and nutrition (small frequent meals). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause fatigue or malaise (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); nausea, vomiting, loss of appetite, or diarrhea (consult prescriber for appropriate medication); or hair loss (reversible). Report unresolved nausea, vomiting, diarrhea, or abdominal pain; difficulty swallowing; rash; or any other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Cosmegen®: 0.5 mg [contains mannitol 20 mg]

Generic AvailableNo

Mechanism of ActionBinds to the guanine portion of DNA intercalating between guanine and cytosine base pairs inhibiting DNA and RNA synthesis and protein synthesis

Pharmacodynamics/Kinetics

Distribution: High concentrations found in bone marrow and tumor cells, submaxillary gland, liver, and kidney; crosses placenta; poor CSF penetration

Metabolism: Hepatic, minimal

Half-life elimination: ~36 hours

Time to peak, serum: I.V.: 2-5 minutes

Excretion: Bile (50%); feces (14%); urine (~10% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis and mucositis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

2009 National Patient Safety Goals: The Joint Commission on Accreditation of Healthcare Organizations requires healthcare organizations that provide anticoagulant therapy to have a process in place to reduce the risk of anticoagulant-associated patient harm. Patients receiving anticoagulants should receive individualized care through a defined process that includes standardized ordering, dispensing, administration, monitoring and education. This does not apply to routine short-term use of anticoagulants for prevention of venous thromboembolism when the expectation is that the patient's laboratory values will remain within or close to normal values (NPSG.03.05.01).

Pronunciation(dal TE pa rin)

U.S. Brand NamesFragmin®

Canadian Brand NamesFragmin®

Pharmacologic CategoryLow Molecular Weight Heparin

Use: Labeled IndicationsPrevention of deep vein thrombosis which may lead to pulmonary embolism, in patients requiring abdominal surgery who are at risk for thromboembolism complications (eg, patients >40 years of age, obesity, patients with malignancy, history of deep vein thrombosis or pulmonary embolism, and surgical procedures requiring general anesthesia and lasting >30 minutes); prevention of DVT in patients undergoing hip-replacement surgery; patients immobile during an acute illness; acute treatment of unstable angina or non-Q-wave myocardial infarction; prevention of ischemic complications in patients on concurrent aspirin therapy; in patients with cancer, extended treatment (6 months) of acute symptomatic venous thromboembolism (DVT and/or PE) to reduce the recurrence of venous thromboembolism

Use: Unlabeled/InvestigationalActive treatment of deep vein thrombosis (noncancer patients)

Dosing: Adults

Abdominal surgery (DVT prophylaxis):

Low-to-moderate DVT risk: SubQ: 2500 int. units 1-2 hours prior to surgery, then once daily for 5-10 days postoperatively

High DVT risk: SubQ: 5000 int. units the evening prior to surgery and then once daily for 5-10 days postoperatively. Alternatively in patients with malignancy: 2500 int. units 1-2 hours prior to surgery, 2500 int. units 12 hours later, then 5000 int. units once daily for 5-10 days postoperatively.

Total hip surgery (DVT prophylaxis): SubQ: **Note:** Three treatment options are currently available. Dose is given for 5-10 days, although up to 14 days of treatment have been tolerated in clinical trials:

Postoperative start:

Initial: 2500 int. units 4-8 hours* after surgery

Maintenance: 5000 int. units once daily; start at least 6 hours after postsurgical dose

Preoperative (starting day of surgery):

Initial: 2500 int. units within 2 hours before surgery

Adjustment: 2500 int. units 4-8 hours* after surgery

Maintenance: 5000 int. units once daily; start at least 6 hours after postsurgical dose

Preoperative (starting evening prior to surgery):

Initial: 5000 int. units 10-14 hours before surgery

Adjustment: 5000 int. units 4-8 hours* after surgery

Maintenance: 5000 int. units once daily, allowing 24 hours between doses.

***Note:** Dose may be delayed if hemostasis is not yet achieved.

Unstable angina or non-Q-wave myocardial infarction: SubQ: 120 int. units/kg body weight (maximum dose: 10,000 int. units) every 12 hours for 5-8 days with concurrent aspirin therapy. Discontinue dalteparin once patient is clinically stable.

Venous thromboembolism: SubQ: Cancer patients:

Initial (month 1): 200 int. units/kg (maximum dose: 18,000 int. units) once daily for 30 days

Maintenance (months 2-6): ~150 int. units/kg (maximum dose: 18,000 int. units) once daily. If platelet count between 50,000-100,000/mm^3, reduce dose by 2,500 int. units until platelet count recovers to ≥100,000/mm^3. If platelet count <50,000/mm^3, discontinue dalteparin until platelet count recover to >50,000/mm^3.

Immobility/acute illness (DVT prophylaxis): 5000 int. units once daily

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentIn cancer patients, receiving treatment for venous thromboembolism, if Cl_{cr} <30 mL/minute, manufacturer recommends monitoring anti-Xa levels to determine appropriate dose.
Administration: I.M.**Do not give I.M.**
Administration: OtherFor deep SubQ injection only. May be injected in a U-shape to the area surrounding the navel, the upper outer side of the thigh, or the upper outer quadrangle of the buttock. Apply pressure to injection site; do not massage. Use thumb and forefinger to lift a fold of skin when injecting dalteparin to the navel area or thigh. Insert needle at a 45- to 90-degree angle. The entire length of needle should be inserted. Do not expel air bubble from fixed-dose syringe prior to injection. Air bubble (and extra solution, if applicable) may be expelled from graduated syringes.

Administration once daily beginning prior to surgery and continuing 5-10 days after surgery prevents deep vein thrombosis in patients at risk for thromboembolic complications. For unstable angina or non-Q-wave myocardial infarction, dalteparin is administered every 12 hours until the patient is stable (5-8 days).

StorageStore at temperatures of 20°C to 25°C (68°F to 77°F). Multidose vials may be stored for up to 2 weeks at room temperature after entering.
ContraindicationsHypersensitivity to dalteparin or any component of the formulation; thrombocytopenia associated with a positive *in vitro* test for antiplatelet antibodies in the presence of dalteparin; hypersensitivity to heparin or pork products; patients with active major bleeding; patients with unstable angina, non-Q-wave MI, or acute venous thromboembolism undergoing regional anesthesia; not for I.M. or I.V. use
Warnings/Precautions

Boxed warnings:

- Neuraxial anesthesia: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Bleeding: Monitor patient closely for signs or symptoms of bleeding. Certain patients are at increased risk of bleeding. Risk factors include bacterial endocarditis; congenital or acquired bleeding disorders; active ulcerative or angiodysplastic GI diseases; severe uncontrolled hypertension; hemorrhagic stroke; or use shortly after brain, spinal, or ophthalmology surgery; in patient treated concomitantly with platelet inhibitors; recent GI bleeding; thrombocytopenia or platelet defects; severe liver disease; hypertensive or diabetic retinopathy; or in patients undergoing invasive procedures. Discontinue if bleeding occurs.

- Hyperkalemia: Monitor for hyperkalemia. Heparin can cause hyperkalemia by affecting aldosterone; similar reactions could occur with LMWHs.

- Methylparaben/propylparaben hypersensitivity: Use with caution in patients with known hypersensitivity to methylparaben or propylparaben.

- Thrombocytopenia: Rare cases of thrombocytopenia have occurred. Use with extreme caution in patients with history of heparin-induced thrombocytopenia; monitor platelet count closely. Consider discontinuation of therapy in any patient developing significant thrombocytopenia related to initiation of dalteparin. Rare cases of thrombocytopenia with thrombosis have occurred. Use caution in patients with congenital or drug-induced thrombocytopenia or platelet defects.

Disease-related concerns:

- Cancer: Cancer patients with thrombocytopenia may require dose adjustments for treatment of acute venous thromboembolism.

- Renal impairment: Use with caution in patients with severe renal failure (has not been studied).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Multidose vials: Contain benzyl alcohol and should not be used in pregnant women. In neonates, large amounts of benzyl alcohol (>100 mg/kg/day) have been associated with fatal toxicity (gasping syndrome).

Other warnings/precautions:

- Conversion to other products: Not to be used interchangeably (unit for unit) with heparin or any other low molecular weight heparins.

- Neuraxial anesthesia: **[U.S. Boxed Warning]: Patients with recent or anticipated neuraxial anesthesia (epidural or spinal anesthesia) are at risk of spinal or epidural hematoma and subsequent paralysis.** Consider risk versus benefit prior to neuraxial anesthesia; risk is increased by concomitant agents which may alter hemostasis, as well as traumatic or repeated epidural or spinal puncture. Patient should be observed closely for bleeding and signs and symptoms of neurological impairment if therapy is administered during or immediately following diagnostic lumbar puncture, epidural anesthesia, or spinal anesthesia.

Geriatric ConsiderationsNo specific recommendations are necessary for the elderly.
Pregnancy Risk FactorB
Pregnancy ConsiderationsMultiple-dose vials contain benzyl alcohol (avoid in pregnant women due to association with gasping syndrome

in premature infants). Adverse effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationEnters breast milk/use caution

Breast-Feeding Considerations

In lactating women receiving prophylactic doses of dalteparin, small amounts of anti-xa activity was noted in breast milk. The milk/plasma ratio was <0.025 to 0.224. Oral absorption of low molecular weight heparin is extremely low.

Adverse Reactions

Note: As with all anticoagulants, bleeding is the major adverse effect of dalteparin. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables.

>10%:

Hematologic: Bleeding (3% to 14%)

1% to 10%:

Hematologic: Wound hematoma (up to 3%)

Hepatic: AST >3 times upper limit of normal (5% to 9%), ALT >3 times upper limit of normal (4% to 10%)

Local: Pain at injection site (up to 12%), injection site hematoma (up to 7%)

<1% (Limited to important or life-threatening): Thrombocytopenia (including heparin-induced thrombocytopenia), allergic reaction (fever, pruritus, rash, injections site reaction, bullous eruption), alopecia, anaphylactoid reaction, operative site bleeding, gastrointestinal bleeding, hemoptysis, skin necrosis, subdural hematoma, thrombosis (associated with heparin-induced thrombocytopenia). Spinal or epidural hematomas can occur following neuraxial anesthesia or spinal puncture, resulting in paralysis.

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Drotrecogin Alfa: Heparin (Low Molecular Weight) may enhance the adverse/toxic effect of Drotrecogin Alfa. This is of most concern with therapeutic doses of LMW heparin. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo biloba, Ginseng (american), Ginseng (panax), Ginseng (siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (s-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet/anticoagulant activity)

Monitoring ParametersPeriodic CBC including platelet count; stool occult blood tests; monitoring of PT and PTT is not necessary. Once patient has received 3-4 doses, anti-Xa levels, drawn 4-6 hours after dalteparin administration, may be used to monitor effect in patients with severe renal dysfunction or if abnormal coagulation parameters or bleeding should occur.

Reference RangeTreatment: Venous thromboembolism: Target anti-Xa range: 0.5-1.5 int. units/mL

Nursing: Physical Assessment/MonitoringEvaluate for increased bleeding risk prior to beginning treatment. Assess other pharmacological or herbal products patient may be taking for potential interactions (especially anything that will impact coagulation or platelet aggregation). Bleeding precautions should be observed during treatment. Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse response (eg, thrombolytic reactions). Teach patient possible side effects/appropriate interventions (eg, bleeding precautions) and adverse symptoms to report.

Monitoring: Lab TestsPeriodic CBC including platelet count; stool occult blood tests; monitoring of PT and PTT is not necessary. Once patient has received 3-4 doses, anti-Xa levels, drawn 4-6 hours after dalteparin administration, may be used to monitor effect in patients with severe renal dysfunction or if abnormal coagulation parameters or bleeding should occur.

Patient EducationDo not take any new medication during therapy unless approved by prescriber (especially anything containing aspirin). This drug can only be administered by injection. You may have a tendency to bleed easily while taking this drug (use caution to prevent falls or bruises or other accidents, brush teeth with soft brush, use waxed dental floss, use electric razor, avoid scissors or sharp knives, and potentially harmful activities). Report unusual fever; unusual bleeding or bruising (bleeding gums, nosebleed, blood in urine, dark stool);

pain in joints or back; severe head pain; skin rash; or redness, swelling, or pain at injection site. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Fragmin®: Antifactor Xa 10,000 int. units per 1 mL (9.5 mL) [contains benzyl alcohol]; antifactor Xa 25,000 units per 1 mL (3.8 mL) [contains benzyl alcohol]

Injection, solution [preservative free]:

Fragmin®: Antifactor Xa 2500 int. units per 0.2 mL (0.2 mL); antifactor Xa 5000 int. units per 0.2 mL (0.2 mL); antifactor Xa 7500 int. units per 0.3 mL (0.3 mL); antifactor Xa 10,000 int. units per 1 mL (1 mL); antifactor Xa 12,500 int. units per 0.5 mL (0.5 mL); antifactor Xa 15,000 int. units per 0.6 mL (0.6 mL); antifactor Xa 18,000 int. units per 0.72 mL (0.72 mL)

Pricing: U.S. (www.drugstore.com)

Injection (Fragmin)

2500 units/0.2 mL (0.2): $26.99

5000 units/0.2 mL (2): $342.29

10000 units/mL (1): $69.99

Mechanism of Action Low molecular weight heparin analog with a molecular weight of 4000-6000 daltons; the commercial product contains 3% to 15% heparin with a molecular weight <3000 daltons, 65% to 78% with a molecular weight of 3000-8000 daltons and 14% to 26% with a molecular weight >8000 daltons; while dalteparin has been shown to inhibit both factor Xa and factor IIa (thrombin), the antithrombotic effect of dalteparin is characterized by a higher ratio of antifactor Xa to antifactor IIa activity (ratio = 4)

Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Duration: >12 hours

Distribution: V_d: 40-60 mL/kg

Bioavailability: SubQ: 81% to 93%

Half-life elimination (route dependent): 2-5 hours

Time to peak, serum: 4 hours

Related Information

- Anticoagulants, Injectable

Pharmacotherapy Pearls Multidose vial contains 14 mg/mL benzyl alcohol.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: As with all anticoagulants, bleeding is the major adverse effect of bivalirudin. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the intensity of anticoagulation and patient susceptibility. Additional adverse effects are often related to idiosyncratic reactions, and the frequency is difficult to estimate. Adverse reactions reported were generally less than those seen with heparin.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Cardiovascular Considerations Low molecular weight heparins (LMWHs) compare favorably to unfractionated heparin (UFH) in the prevention and treatment of venous thromboembolism. LMWHs are associated with less thrombocytopenia, compared to heparin, and do not require routine therapeutic monitoring.

Obesity/Renal Dysfunction: There is no consensus for adjusting/correcting the weight-based dosage of LMWH for patients who are morbidly obese. Monitoring of antifactor Xa concentration 4 hours after injection may be warranted. Patients who have a reduction in calculated creatinine clearance are at risk of accumulated anticoagulant effect when they are treated with certain LMWHs. All LMWHs may not behave the same in patients with renal dysfunction. Some clinicians monitor anti-Xa levels for patients with Cl_{cr} <30 mL/minute.

Anesthesia and Critical Care Concerns/Other Considerations Many critically-ill and surgery patients require preventive measures for venous thromboembolism. LMWHs compare favorably to unfractionated heparin in the prevention and treatment of venous thromboembolism. LMWHs are associated with less thrombocytopenia, compared to heparin, and do not require routine therapeutic monitoring.

Obesity/Renal Dysfunction: There is no consensus for adjusting/correcting the weight-based dosage of LMWH for patients who are morbidly obese. Monitoring of antifactor Xa concentration 4 hours after injection may be warranted. Patients who have a reduction in calculated creatinine clearance are at risk of accumulated anticoagulant effect when they are treated with certain LMWHs. All LMWHs may not behave the same in patients with renal dysfunction. Some clinicians monitor anti-Xa levels for patients with Cl_{cr} <30 mL/minute.

Index Terms Dalteparin Sodium; NSC-714371

Medication Safety Issues

Sound-alike/look-alike issues:

Orgaran® may be confused with argatroban

Pronunciation(da NAP a roid)

Canadian Brand Names Orgaran®

Pharmacologic Category Anticoagulant

Use: Labeled Indications Prevention of postoperative deep vein thrombosis following elective hip replacement surgery

Use: Unlabeled/Investigational Systemic anticoagulation for patients with heparin-induced thrombocytopenia: factor Xa inhibition is used to monitor degree of anticoagulation if necessary

Dosing: Adults

Prevention of DVT following hip replacement: SubQ: 750 anti-Xa units twice daily; beginning 1-4 hours before surgery and then not sooner than 2 hours after surgery and every 12 hours until the risk of DVT has diminished, the average duration of therapy is 7-10 days

Treatment (unlabeled uses): See table.

Adult Danaparoid Treatment Dosing Regimens (not FDA approved)

	Body Weight (kg)	I.V. Bolus aFXaU	Long-Term Infusion aFXaU	Level of aFXaU/mL	Monitoring
Deep Vein Thrombosis OR Acute Pulmonary Embolism	<55 55-90 >90	1250 2500 3750	400 units/h over 4 h, then 300 units/h over 4 h, then 150-200 units/h maintenance dose	0.5-0.8	Days 1-3 daily, then every alternate day
Deep Vein Thrombosis OR Pulmonary Embolism >5 d old	<90 >90	1250 1250	SubQ: 3 x 750/d SubQ: 3 x 1250/d	<0.5	Not necessary
Embolectomy	<90 >90 and high risk	2500 preoperatively 2500 preoperatively	SubQ: 2 x 1250/d postoperatively 150-200 units/h I.V.; perioperative arterial irrigation, if necessary: 750 units/20 mL NaCl	<0.4 0.5 0.8	Not necessary Days 1-3 daily, then every alternate day
Peripheral Arterial Bypass		2500 preoperatively	150-200 units/h	0.5-0.8	Days 1-3 daily, then every alternate day
Cardiac Catheter	<90 >90	2500 preoperatively 3750 preoperatively			
Surgery (excluding vascular)			SubQ: 750, 1-4 h preoperatively SubQ: 750, 2-5 h	<0.35	Not necessary

			postoperatively, then 2 x 750/d		

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricSubQ: Children: Safety and effectiveness have not been established.

Dosing: Renal ImpairmentAdjustment may be necessary in patients with severe renal impairment. Patients with serum creatinine levels ≥2.0 mg/dL should be carefully monitored. SubQ: Hemodialysis: See table.

Hemodialysis With Danaparoid Sodium

Dialysis on alternate days:	**Dosage prior to dialysis in aFXaU (dosage for body wt <55 kg):**	
First dialysis	3750 (<55 kg 2500)	
Second dialysis	3750 (<55 kg 2000)	
Further dialysis:		
aFXa level before dialysis (eg, day 5)	**Bolus before next dialysis, aFXaU (eg, day 7)**	**aFXa level during dialysis**
<0.3	3000 (<55 kg 2000)	0.5-0.8
0.3-0.35	2500 (<55 kg 2000)	
0.35-0.4	2000 (<55 kg 1500)	
>0.4	No bolus; if fibrin strands occur, 1500 aFXaU I.V.	
Monitoring: 30 minutes before dialysis and after 4 hours of dialysis		
Daily Dialysis		
First dialysis	3750 (<55 kg 2500)	
Second dialysis	2500 (<55 kg 2000)	
Further dialyses	See above	
As with “dialysis on alternate days”, always take the aFXa activity preceding the previous dialysis as a basis for the current dosage.		

Administration: OtherAdminister by subcutaneous injection, **not** I.M. Have patient lie down and administer by deep SubQ injection using a fine needle (25- to 26-gauge). Rotate sites of injection.

StorageStore intact vials or ampuls under refrigeration.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to danaparoid or thrombocytopenia associated with a positive *in vitro* test for antiplatelet antibodies in the presence of danaparoid; hypersensitivity to pork products or to sulfites (contains metabisulfite); patients with active major bleeding; severe hemorrhagic diathesis (hemophilia, idiopathic thrombocytopenic purpura); not for I.M. or I.V. use

Allergy Considerations

- Low Molecular Weight Heparin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Monitor patient closely for signs or symptoms of bleeding. Certain patients are at increased risk of bleeding; risk factors include bacterial endocarditis; congenital or acquired bleeding disorders; active ulcerative or angiodysplastic GI diseases; severe uncontrolled hypertension; hemorrhagic stroke; or use shortly after brain, spinal, or ophthalmology surgery; in patient treated concomitantly with platelet inhibitors; recent GI bleeding; thrombocytopenia or platelet defects; severe liver disease; hypertensive or diabetic retinopathy; or in patients undergoing invasive procedures. Discontinue if bleeding occurs.

- Hyperkalemia: Monitor for hyperkalemia. Heparin can cause hyperkalemia by affecting aldosterone; similar reactions could occur with danaparoid.

- Methylparaben/propylparaben hypersensitivity: Use with caution in patients with known hypersensitivity to methylparaben or propylparaben.

Disease-related concerns:

- Heparin-induced thrombocytopenia: Use with caution in patients with history of heparin-induced thrombocytopenia.
- Renal impairment: Use with caution in patients with severe renal failure (has not been studied).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Sodium sulfite: This product contains sodium sulfite which may cause allergic-type reactions, including anaphylactic symptoms and life-threatening asthmatic episodes in susceptible people; this is seen more frequently in asthmatics.

Other warnings/precautions:

- Conversion to other products: Not to be used interchangeably (unit for unit) with heparin or any other low molecular weight heparins.
- Neuraxial anesthesia: **Patients with recent or anticipated neuraxial anesthesia (epidural or spinal anesthesia) are at risk of spinal or epidural hematoma and subsequent paralysis.** Consider risk versus benefit prior to neuraxial anesthesia; risk is increased by concomitant agents which may alter hemostasis, as well as traumatic or repeated epidural or spinal puncture. Patient should be observed closely for bleeding if therapy is administered during or immediately following diagnostic lumbar puncture, epidural anesthesia, or spinal anesthesia.

Geriatric ConsiderationsEvaluation of elderly's creatinine serum concentrations is important before initiating therapy.
Pregnancy Risk FactorB
LactationExcretion in breast milk unknown/compatible
Adverse ReactionsAs with all anticoagulants, bleeding is the major adverse effect of danaparoid. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables.

>10%:

Central nervous system: Fever (22%)

Gastrointestinal: Nausea (4% to 14%), constipation (4% to 11%)

1% to 10%:

Cardiovascular: Peripheral edema (3%), edema (3%)

Central nervous system: Insomnia (3%), headache (3%), asthenia (2%), dizziness (2%), pain (9%)

Dermatologic: Rash (2% to 5%), pruritus (4%)

Gastrointestinal: Vomiting (3%)

Genitourinary: Urinary tract infection (3% to 4%), urinary retention (2%)

Hematologic: Anemia (2%)

Local: Injection site pain (8% to 14%), injection site hematoma (5%)

Neuromuscular & skeletal: Joint disorder (3%)

Miscellaneous: Infection (2%)

<1% (Limited to important or life-threatening): Spinal or epidural hematomas can occur following neuraxial anesthesia or spinal puncture, resulting in paralysis. Risk is increased in patients with indwelling epidural catheters or concomitant use of other drugs affecting hemostasis, thrombocytopenia, hyperkalemia, wound infection, skin rash, allergic reaction.

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Drotrecogin Alfa: Danaparoid may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, and ginseng (all have additional antiplatelet activity).

Monitoring ParametersPlatelets, occult blood, and anti-Xa activity, if available; the monitoring of PT and/or PTT is not necessary

Nursing: Physical Assessment/MonitoringSee Contraindications, Warnings/Precautions, and Dosing for use cautions. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially anything that will impact coagulation or platelet aggregation - see Drug Interactions). Assess results of laboratory tests (see above), therapeutic effectiveness, and adverse reactions (eg, thrombolytic reactions - see Adverse Reactions and Overdose/Toxicology). Teach patient possible side effects/appropriate interventions (eg, bleeding precautions) and adverse symptoms to report (see Patient Education).

Monitoring: Lab TestsPlatelets, occult blood, anti-Xa activity, if available; the monitoring of PT and/or PTT is not necessary.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. This drug can only be administered by injection. You may have a tendency to bleed easily while taking this drug (brush teeth with soft brush, floss with waxed floss, use electric razor, avoid scissors or sharp knives and potentially harmful activities). Report unusual fever; unusual bleeding or bruising (bleeding gums, nosebleed, blood in urine, dark stool); pain in joints or back; severe head pain; skin rash; or redness, swelling, or pain at injection site.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution:

Orgaran® [CAN]: 750 anti-Xa units/0.6 mL (0.6 mL) [not available in the U.S.]

Generic AvailableNo

ManufacturerOrganon Inc

Mechanism of ActionPrevents fibrin formation in coagulation pathway via thrombin generation inhibition by anti-Xa and anti-IIa effects.

Pharmacodynamics/Kinetics

Onset of action: Peak effect: SubQ: Maximum antifactor Xa and antithrombin (antifactor IIa) activities occur in 2-5 hours

Half-life elimination, plasma: Mean: Terminal: ~24 hours

Excretion: Primarily urine

Related Information

- Anticoagulants, Injectable

Pharmacotherapy PearlsA 750 anti-Xa unit dose of danaparoid is approximately equivalent to 55 mg of danaparoid.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: As with all anticoagulants, bleeding is the major adverse effect of danaparoid. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsDanaparoid Sodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Danazol may be confused with Dantrium®

Danocrine® may be confused with Dacriose®

Pronunciation(DA na zole)

U.S. Brand NamesDanocrine® [DSC]

Canadian Brand NamesCyclomen®; Danocrine®

Pharmacologic CategoryAndrogen

Use: Labeled IndicationsTreatment of endometriosis, fibrocystic breast disease, and hereditary angioedema

Dosing: Adults

Endometriosis (females): Oral: Initial: 200-400 mg/day in 2 divided doses for mild disease; individualize dosage. Usual maintenance dose: 800 mg/day in 2 divided doses to achieve amenorrhea and rapid response to painful symptoms. Continue therapy uninterrupted for 3-6 months (up to 9 months).

Fibrocystic breast disease (females): Oral: Range: 100-400 mg/day in 2 divided doses

Hereditary angioedema (males/females): Oral: Initial: 200 mg 2-3 times/day; after favorable response, decrease the dosage by 50% or less at intervals of 1-3 months or longer if the frequency of attacks dictates. If an attack occurs, increase the dosage by up to 200 mg/day.

Dosing: ElderlyRefer to adult dosing.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to danazol or any component of the formulation; undiagnosed genital bleeding; pregnancy; breast-feeding; porphyria; markedly impaired hepatic, renal, or cardiac function

Allergy Considerations

- Androgen Allergy

Warnings/Precautions

Boxed warnings:

• Hepatic effects: See “Concerns related to adverse effects” below.

• Intracranial hypertension: See “Concerns related to adverse effects” below.

• Pregnancy: See “Special populations” below.

• Thromboembolic events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

• Androgenic effects: May cause nonreversible androgenic effects.

• Blood lipid changes: Anabolic steroids may cause blood lipid changes with increased risk of arteriosclerosis.

• Hepatic effects: **[U.S. Boxed Warning]: Peliosis hepatis and benign hepatic adenoma have been reported with long-term use** (may be complicated by acute intra-abdominal hemorrhage).

• Intracranial hypertension: **[U.S. Boxed Warning]: May cause benign intracranial hypertension (pseudotumor cerebri);** monitor for headache, nausea/vomiting, visual disturbances and/or papilledema.

• Thromboembolic events: **[U.S. Boxed Warning]: Thromboembolism, thrombotic, and thrombophlebitic events have been reported (including life-threatening or fatal strokes).**

Disease-related concerns:

• Diabetes: Use with caution in patients with diabetes mellitus; monitor carefully.

• Edematous conditions: Use with caution in patients with conditions influenced by edema (eg, cardiovascular disease, migraine, seizure disorder, renal impairment); may cause fluid retention.

- Fibrocystic disease: Breast cancer should be ruled out prior to treatment for fibrocystic breast disease.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Porphyria: Use with caution in patients with a history of porphyria.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Pregnancy must be ruled out prior to treatment;** a nonhormonal method of contraception should be used during therapy.

Pregnancy Risk FactorX
Pregnancy Considerations**[U.S. Boxed Warning]: Pregnancy should be ruled out prior to treatment** using a sensitive test (beta subunit test, if available). Nonhormonal contraception should be used during therapy. May cause androgenic effects to the female fetus; clitoral hypertrophy, labial fusion, urogenital sinus defect, vaginal atresia, and ambiguous genitalia have been reported.
LactationEnters breast milk/contraindicated
Adverse ReactionsFrequency not defined.

Cardiovascular: Benign intracranial hypertension (rare), edema, flushing, hypertension

Central nervous system: Anxiety (rare), chills (rare), convulsions (rare), depression, dizziness, emotional lability, fainting, fever (rare), Guillain-Barré syndrome, headache, nervousness, sleep disorders, tremor

Dermatologic: Acne, hair loss, mild hirsutism, maculopapular rash, papular rash, petechial rash, pruritus, purpuric rash, seborrhea, Stevens-Johnson syndrome (rare), photosensitivity (rare), urticaria, vesicular rash

Endocrine & metabolic: Amenorrhea (which may continue post therapy), breast size reduction, clitoris hypertrophy, glucose intolerance, HDL decreased, LDL increased, libido changes, nipple discharge, menstrual disturbances (spotting, altered timing of cycle), semen abnormalities (changes in volume, viscosity, sperm count/motility), spermatogenesis reduction

Gastrointestinal: Appetite changes (rare), bleeding gums (rare), constipation, gastroenteritis, nausea, pancreatitis (rare), vomiting, weight gain

Genitourinary: Vaginal dryness, vaginal irritation, pelvic pain

Hematologic: Eosinophilia, erythrocytosis (reversible), leukocytosis, leukopenia, platelet count increased, polycythemia, RBC increased, thrombocytopenia

Hepatic: Cholestatic jaundice, hepatic adenoma, jaundice, liver enzymes increased, malignant tumors (after prolonged use), peliosis hepatis

Neuromuscular & skeletal: Back pain, carpal tunnel syndrome (rare), extremity pain, joint lockup, joint pain, joint swelling, muscle cramps, neck pain, paresthesia, spasms, weakness

Ocular: Cataracts (rare), visual disturbances

Renal: Hematuria

Respiratory: Nasal congestion (rare)

Miscellaneous: Diaphoresis, voice change (hoarseness, sore throat, instability, deepening of pitch)

Metabolism/Transport Effects**Inhibits** CYP3A4 (weak)
Drug Interactions

CarBAMazepine: Danazol may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

CycloSPORINE: Androgens may enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Danazol may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Androgens may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Delays time to peak; high-fat meal increases plasma concentration
Test InteractionsTestosterone, androstenedione, dehydroepiandrosterone
Monitoring ParametersSigns and symptoms of intracranial hypertension (papilledema, headache, nausea, vomiting), lipoproteins, androgenic changes, hepatic function
Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions (eg, anticoagulants and hypoglycemic agents). Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse response (eg, hypertension, increased LDL, CNS changes, jaundice, hematuria). Caution patients with diabetes to monitor glucose levels closely (may enhance the glucose-lowering effect of hypoglycemic agents). Teach patient proper use, possible side effects/appropriate interventions (eg, good self-breast-exam technique), and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to female patients of childbearing age unless capable of complying with barrier contraceptive use. Instruct patient in appropriate contraceptive measures.
Monitoring: Lab TestsLiver and renal function
Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Take as directed; do not discontinue without consulting prescriber.

Therapy may take up to several months depending on purpose for therapy. If you have diabetes, monitor serum glucose closely and notify prescriber of changes; this medication can alter hypoglycemic requirements. Consult prescriber for appropriate self-breast-exam technique. May cause headache, sleeplessness, anxiety (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); acne, growth of body hair, deepening of voice, loss of libido, impotence, or menstrual irregularity (usually reversible). Report changes in menstrual pattern; deepening of voice or unusual growth of body hair; persistent penile erections; fluid retention (eg, swelling of ankles, feet, or hands, respiratory difficulty, or sudden weight gain); change in color of urine or stool; yellowing of eyes or skin; unusual bruising or bleeding; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. This drug may cause severe fetal defects. Do not donate blood during or for 1 month following therapy. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule: 50 mg, 100 mg, 200 mg

Danocrine®: 50 mg, 100 mg, 200 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Danazol)

50 mg (30): $52.99

100 mg (30): $68.60

200 mg (30): $110.76

Mechanism of ActionSuppresses pituitary output of follicle-stimulating hormone and luteinizing hormone that causes regression and atrophy of normal and ectopic endometrial tissue; decreases rate of growth of abnormal breast tissue; reduces attacks associated with hereditary angioedema by increasing levels of C4 component of complement

Pharmacodynamics/Kinetics

Onset of action: Therapeutic: ~4 weeks

Metabolism: Extensively hepatic, primarily to 2-hydroxymethylethisterone

Half-life elimination: 4.5 hours (variable)

Time to peak, serum: Within 2 hours

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Dantrium® may be confused with danazol, Daraprim®

Pronunciation(DAN troe leen)

U.S. Brand NamesDantrium®

Canadian Brand NamesDantrium®

Pharmacologic CategorySkeletal Muscle Relaxant

Use: Labeled IndicationsTreatment of spasticity associated with spinal cord injury, stroke, cerebral palsy, or multiple sclerosis; treatment of malignant hyperthermia

Use: Unlabeled/InvestigationalNeuroleptic malignant syndrome (NMS)

Dosing: Adults

Spasticity: Oral: 25 mg/day to start, increase frequency to 2-4 times/day, then increase dose by 25 mg every 4-7 days to a maximum of 100 mg 2-4 times/day or 400 mg/day

Malignant hyperthermia:

Preoperative prophylaxis:

Oral: 4-8 mg/kg/day in 4 divided doses, begin 1-2 days prior to surgery with last dose 3-4 hours prior to surgery

I.V.: 2.5 mg/kg ~$1^{1}/_{4}$ hours prior to anesthesia and infused over 1 hour with additional doses as needed and individualized

Crisis: I.V.: 2.5 mg/kg; may repeat dose up to cumulative dose of 10 mg/kg; if physiologic and metabolic abnormalities reappear, repeat regimen

Postcrisis follow-up: Oral: 4-8 mg/kg/day in 4 divided doses for 1-3 days; I.V. dantrolene may be used when oral therapy is not practical; individualize dosage beginning with 1 mg/kg or more as the clinical situation dictates

Neuroleptic malignant syndrome (unlabeled use): I.V.: 1 mg/kg; may repeat dose up to maximum cumulative dose of 10 mg/kg, then switch to oral dosage

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Spasticity: Oral: Initial: 0.5 mg/kg/dose twice daily, increase frequency to 3-4 times/day at 4- to 7-day intervals, then increase dose by 0.5 mg/kg to a maximum of 3 mg/kg/dose 2-4 times/day up to 400 mg/day

Malignant hyperthermia: Refer to adult dosing.

Administration: I.V.Therapeutic or emergency dose can be administered with rapid continuous I.V. push. Follow-up doses should be administered over 2-3 minutes.

Administration: I.V. DetailAvoid extravasation; tissue irritant. 36 vials are needed for adequate hyperthermia therapy.

ReconstitutionReconstitute vial by adding 60 mL of sterile water for injection USP (**not bacteriostatic water for injection**). Protect from light. Use within 6 hours; avoid glass bottles for I.V. infusion.

Extemporaneously PreparedA 5 mg/mL suspension may be made by adding five 100 mg capsules to a citric acid solution (150 mg citric acid powder in 10 mL water) and then adding syrup to a total volume of 100 mL; stable 2 days in refrigerator

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 1st ed, Cincinnati, OH: Harvey Whitney Books Co, 1990.

ContraindicationsActive hepatic disease; should not be used where spasticity is used to maintain posture or balance

Warnings/Precautions

Boxed warnings:

- Hepatotoxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hepatotoxicity: **[U.S. Boxed Warning]: Has potential for hepatotoxicity.** Overt hepatitis has been most frequently observed between the third and twelfth month of therapy. Hepatic injury appears to be greater in females and in patients >35 years of age. Idiosyncratic and hypersensitivity reactions (sometimes fatal) of the liver have also occurred.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with impaired cardiac function.
- Respiratory disease: Use with caution in patients with impaired pulmonary function.

Geriatric ConsiderationsThere is little experience with this drug in the elderly.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Drowsiness, dizziness, lightheadedness, fatigue

Dermatologic: Rash

Gastrointestinal: Diarrhea (mild), nausea, vomiting

Neuromuscular & skeletal: Muscle weakness

1% to 10%:

Cardiovascular: Pleural effusion with pericarditis

Central nervous system: Chills, fever, headache, insomnia, nervousness, mental depression

Gastrointestinal: Diarrhea (severe), constipation, anorexia, stomach cramps

Ocular: Blurred vision

Respiratory: Respiratory depression

<1%: Seizure, confusion, hepatitis, hepatic necrosis

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersMotor performance should be monitored for therapeutic outcomes; nausea, vomiting, and liver function tests should be monitored for potential hepatotoxicity; intravenous administration requires cardiac monitor and blood pressure monitor

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. **I.V.:** Monitor vital signs, cardiac function, respiratory status, and I.V. site (extravasation very irritating to tissues). Monitor effectiveness of therapy and adverse reactions at beginning and periodically during therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLiver function for potential hepatotoxicity

Patient EducationTake exactly as directed. Do not increase dose or discontinue without consulting prescriber. Do not use alcohol, prescriptive or OTC antidepressants, sedatives, or pain medications without consulting prescriber. You may experience drowsiness, dizziness, lightheadedness (avoid driving or engaging in tasks that require alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, or sucking hard candy may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report excessive confusion; drowsiness or mental agitation; chest pain, palpitations, or respiratory difficulty; skin rash; or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as sodium: 25 mg, 50 mg, 100 mg

Dantrium®: 25 mg, 50 mg, 100 mg

Injection, powder for reconstitution, as sodium:

Dantrium®: 20 mg [contains mannitol 3 g]

Generic AvailableYes: Capsule
ManufacturerProcter & Gamble Co
Pricing: U.S. (www.drugstore.com)

Capsules (Dantrium)

25 mg (45): $58.99

50 mg (45): $81.99

100 mg (45): $99.99

Capsules (Dantrolene Sodium)

25 mg (30): $31.99

50 mg (45): $63.99

100 mg (45): $66.99

Mechanism of ActionActs directly on skeletal muscle by interfering with release of calcium ion from the sarcoplasmic reticulum; prevents or reduces the increase in myoplasmic calcium ion concentration that activates the acute catabolic processes associated with malignant hyperthermia
Pharmacodynamics/Kinetics

Absorption: Oral: Slow and incomplete

Metabolism: Hepatic

Half-life elimination: 8.7 hours

Excretion: Feces (45% to 50%); urine (25% as unchanged drug and metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDrowsiness is common; may cause insomnia, nervousness, confusion, or depression
Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropic may result in additive sedation; use to treat neuroleptic malignant syndrome
Index TermsDantrolene Sodium

Dapsone

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Dapsone may be confused with Diprosone®

Pronunciation(DAP sone)
U.S. Brand NamesAczone®
Pharmacologic CategoryAntibiotic, Miscellaneous; Topical Skin Product, Acne
Use: Labeled IndicationsTreatment of leprosy and dermatitis herpetiformis (infections caused by *Mycobacterium leprae*); topical treatment of acne vulgaris
Use: Unlabeled/InvestigationalProphylaxis of toxoplasmosis in severely-immunocompromised patients; alternative agent for *Pneumocystis carinii* pneumonia prophylaxis (monotherapy) and treatment (in combination with trimethoprim)
Use: DentalUsed in lupus and in selected ulcerative conditions in consult with patient's physician
Dosing: Adults

Acne: Topical: Apply pea-sized amount (approximately) in a thin layer to affected areas twice daily; reevaluate patient if no improvement after 12 weeks of therapy.

Leprosy: Oral: 50-100 mg/day for 3-10 years

Dermatitis herpetiformis: Oral: Initial: 50 mg/day, increase to 300. mg/day, or higher to achieve full control. Reduce dosage to minimum level as soon as possible.

Pneumonia caused by*Pneumocystis carinii*(unlabeled use): Oral:

Prophylaxis: 100 mg/day

Treatment: Adults: 100 mg/day in combination with trimethoprim (15-20 mg/kg/day) for 21 days

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Acne: Topical: Children ≥12 years: Refer to adult dosing.

Leprosy: Oral: Children: 1-2 mg/kg/24 hours, up to a maximum of 100 mg/day

Prophylaxis of*Pneumocystis carinii*pneumonia (unlabeled use): Oral: Children >1 month: 2 mg/kg/day once daily (maximum dose: 100 mg/day) or 4 mg/kg/dose once weekly (maximum dose: 200 mg)

Dosing: Renal ImpairmentNo guidelines are available.
Administration: OralMay administer with meals if GI upset occurs.
Administration: TopicalTopical: Skin should be clean and dry before applying. Rub in gently and completely. Wash hands after applying. Gel may be gritty. For external use only; avoid applying to inside nose, mouth, eyes, and mucous membranes.
Dietary ConsiderationsOral: Do not give with antacids, alkaline foods, or drugs.
StorageStore at 20°C to 25°C (68°F to 76°F). Protect tablets from light. Do not freeze gel.
Extemporaneously PreparedOne report indicated that dapsone may not be well absorbed when administered to children as suspensions made from pulverized tablets

Mirochnick M, Clarke D, Brenn A, et al, "Low Serum Dapsone Concentrations in Children Receiving an Extemporaneously Prepared Oral Formulation," [Abstract Th B 365], APS-SPR, Baltimore, MD: 1992.

Jacobus Pharmaceutical Company (609) 921-7447 makes a 2 mg/mL proprietary liquid formulation available under an IND for the prophylaxis of *Pneumocystis carinii* pneumonia

ContraindicationsHypersensitivity to dapsone or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Aplastic anemia, agranulocytosis and other severe blood dyscrasias have resulted in death; monitor carefully.
- Dermatologic reactions: Serious dermatologic reactions (including toxic epidermal necrolysis) are rare but potential occurrences.
- Peripheral neuropathy: Motor loss and muscle weakness have been reported with use.
- Sulfonamide allergy: Use with caution in patients with hypersensitivity to other sulfonamides; sulfone reactions may also occur as

potentially fatal hypersensitivity reactions, these, but not leprosy reactional states, require drug discontinuation.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea and pseudomembranous colitis.

Disease-related concerns:

- Anemia: Use with caution in patients with severe anemia; treat prior to therapy.

Special populations:

- G6PD deficiency: Use with caution in patients with G6PD deficiency.

- Hemoglobin M deficiency: Use with caution in patients with hemoglobin M deficiency.

- Methemoglobin reductase deficiency: Use with caution in patients with methemoglobin reductase deficiency.

- Pediatrics: Safety and efficacy of topical dapsone have not been established in children <12 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use during pregnancy when the benefit to the mother outweighs the potential risk to the fetus.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Adverse ReactionsAdverse reactions reported for oral formulation unless otherwise noted.

>10%: Hematologic: Hemolysis (dose related; seen in patients with and without G6PD deficiency), hemoglobin decrease (1-2 g/dL; almost all patients), reticulocyte increase (2% to 12%), methemoglobinemia, red cell life span shortened

Frequency not always defined.

Cardiovascular: Facial edema (topical), tachycardia

Central nervous system: Depression (topical), fever, headache, insomnia, psychosis (oral/topical), suicide attempt (topical), tonic clonic movement (topical), vertigo

Dermatologic: Bullous and exfoliative dermatitis, erythema nodosum, exfoliative dermatitis, morbilliform and scarlatiniform reactions, phototoxicity, Stevens-Johnson syndrome, toxic epidural necrolysis, urticaria

Endocrine & metabolic: Hypoalbuminemia (without proteinuria), male infertility

Gastrointestinal: Abdominal pain (oral/topical), nausea, pancreatitis (oral/topical), vomiting (oral/topical)

Hematologic: Agranulocytosis, anemia, leukopenia, pure red cell aplasia (case report)

Hepatic: Cholestatic jaundice, hepatitis

Neuromuscular & skeletal: Drug-induced lupus erythematosus, lower motor neuron toxicity (prolonged therapy), peripheral neuropathy (rare, nonleprosy patients)

Ocular: Blurred vision

Otic: Tinnitus

Renal: Albuminuria, nephrotic syndrome, renal papillary necrosis

Respiratory: Interstitial pneumonitis, pulmonary eosinophilia, sinusitis (topical 2%)

Miscellaneous: Infectious mononucleosis-like syndrome (rash, fever, lymphadenopathy, hepatic dysfunction)

Metabolism/Transport Effects**Substrate** of CYP2C8 (minor), 2C9 (major), 2C19 (minor), 2E1 (minor), 3A4 (major)

Drug Interactions

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Dapsone. Didanosine enteric coated capsules should not affect dapsone. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Dapsone. *Risk D: Consider therapy modification*

Trimethoprim: May increase the serum concentration of Dapsone. Dapsone may increase the serum concentration of Trimethoprim. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Dapsone. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease dapsone levels.

Monitoring Parameters

Oral: Check G6PD levels prior to initiation. Monitor patients for signs of jaundice and hemolysis; CBC weekly for first month, monthly for 6 months and semiannually thereafter.

Topical: For patients at risk of anemia, monitor with CBC, reticulocyte counts at baseline and routinely thereafter.

Nursing: Physical Assessment/MonitoringUse with caution and monitor closely in patients with severe anemia, G6PD deficiency, hepatic function impairment. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking. Assess results of laboratory tests (CBC and LFT), therapeutic effectiveness (according to purpose for use), and adverse response. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsLiver function, CBC, reticulocyte counts

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed; do not discontinue without consulting prescriber. Do not take with antacids, alkaline foods, or other medication. Therapy may take 3-10 years for leprosy. Frequent blood tests may be required. If rash develops, discontinue and notify prescriber. Report persistent sore throat, fever, chills; constant fatigue; yellowing of skin or eyes; or easy bruising or bleeding. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, topical:

Aczone®: 5% (30 g)

Tablet: 25 mg, 100 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Tablets (Dapsone)

25 mg (30): $15.99

100 mg (30): $15.99

Mechanism of ActionCompetitive antagonist of para-aminobenzoic acid (PABA) and prevents normal bacterial utilization of PABA for the synthesis of folic acid

Pharmacodynamics/Kinetics

Absorption:

Oral: Well absorbed

Topical: ~1% of the absorption of 100 mg tablet

Distribution: V_d: 1.5 L/kg; throughout total body water and present in all tissues, especially liver and kidney

Metabolism: Hepatic; forms metabolite

Half-life elimination: 30 hours (range: 10-50 hours)

Excretion: Urine (~85%)

Related Information

Impurity Found in Daptomycin Stored in ReadyMED® Elastomeric Infusion Pumps - April 2008

Cubist Pharmaceuticals, Inc is informing Healthcare Professionals of the presence of 2-mercaptobenzothiazole (MBT) found in reconstituted daptomycin (Cubicin®) solutions stored in ReadyMED® elastomeric infusion pumps (Cardinal Health, Inc). This impurity has been associated with dermal sensitization (cutaneous exposure) and tumorigenesis (chronic animal exposure) and is believed to leach from rubber components of the pump. Importantly, Cubist investigations have shown that daptomycin is stable, and free from impurities when stored in the Eclipse® pump system (I-Flow Corporation). Additionally, there are no reports of MBT contamination of reconstituted daptomycin used in other standard infusion devices. Until further information is available, the company has advised that daptomycin should not be prepared using the ReadyMED® pump.

Additional information may be found at: http://www.fda.gov/medwatch/safety/2008/safety08.htm#cubicin

Medication Safety Issues

Sound-alike/look-alike issues:

Cubicin® may be confused with Cleocin®

DAPTOmycin may be confused with DACTINomycin

Pronunciation(DAP toe mye sin)
U.S. Brand NamesCubicin®
Canadian Brand NamesCubicin®
Pharmacologic CategoryAntibiotic, Cyclic Lipopeptide
Use: Labeled IndicationsTreatment of complicated skin and skin structure infections caused by susceptible aerobic gram-positive organisms; *Staphylococcus aureus* bacteremia, including right-sided infective endocarditis caused by MSSA or MRSA
Use: Unlabeled/InvestigationalTreatment of severe infections caused by MRSA or VRE
Dosing: Adults

Skin and/or skin structure infections (complicated): I.V.: 4 mg/kg once daily for 7-14 days

Bacteremia, right-sided endocarditis caused by MSSA or MRSA: I.V.: 6 mg/kg once daily for 2-6 weeks

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment

Cl_{cr} <30 mL/minute:

Skin and soft tissue infections: 4 mg/kg every 48 hours

Staphylococcal bacteremia: 6 mg/kg every 48 hours

Hemodialysis (administer after hemodialysis) and/or CAPD: Dose as in Cl_{cr} <30 mL/minute

Continuous renal replacement therapy (CRRT): Dose as in Cl_{cr} <30 mL/minute

Dosing: Hepatic ImpairmentNo adjustment required for mild-to-moderate impairment (Child-Pugh Class A or B). Not evaluated in severe hepatic impairment.
Calculations

- Creatinine Clearance: Adults

Administration: I.V.Infuse over 30 minutes.
StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F). Reconstituted solution (either in vial or in infusion bag) is stable for a cumulative time of 12 hours at room temperature and 48 hours if refrigerated (2°C to 8°C).
ReconstitutionReconstitute vial with 10 mL NS. Add NS to vial and rotate gently to wet powder. Allow to stand for 10 minutes, then gently swirl to obtain completely reconstituted solution. Do not shake or agitate vial vigorously. Should be further diluted following reconstitution in an appropriate volume of NS.
CompatibilityStable in NS or LR; **incompatible** with dextrose-containing solutions.
ContraindicationsHypersensitivity to daptomycin or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Myopathy: May be associated with an increased incidence of myopathy; discontinue in patients with signs and symptoms of myopathy in conjunction with an increase in CPK (>5 times ULN or 1000 units/L) or in asymptomatic patients with a CPK ≥10 times ULN. Myopathy may occur more frequently at dose and/or frequency in excess of recommended dosages. Use caution in patients receiving other drugs associated with myopathy (eg, HMG-CoA reductase inhibitors).

- Peripheral neuropathy: Symptoms suggestive of peripheral neuropathy have been observed with treatment; monitor for new-onset or worsening neuropathy.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea and pseudomembranous colitis.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Pneumonia use: Not indicated for the treatment of pneumonia due to poor lung penetration.

Geriatric ConsiderationsThe manufacturer reports that in studies of complicated skin and skin structure infections, elderly patients had a lower clinical success rate and a higher incidence of adverse effects (no quantitative data provided in product labeling). Adjust dose in renal impairment.

Pregnancy Risk FactorB

Pregnancy ConsiderationsBecause adverse events were not observed in animal reproduction studies, daptomycin is classified as pregnancy category B. There are no adequate and well-controlled studies in pregnant women

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if daptomycin is excreted in breast milk. The manufacturer recommends caution if daptomycin is used during breast-feeding. The high molecular weight of daptomycin may limit the transfer to the maternal milk. If daptomycin reaches the breast milk, nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- DAPTOmycin in Pregnancy & Lactation

Adverse Reactions

>10%:

Gastrointestinal: Diarrhea (5% to 12%), vomiting (3% to 12%), constipation (6% to 11%)

Hematologic: Anemia (2% to 13%)

1% to 10%:

Cardiovascular: Peripheral edema (7%), chest pain (7%), hypertension (1% to 6%), hypotension (2% to 5%)

Central nervous system: Insomnia (5% to 9%), headache (5% to7%), fever (2% to 7%), dizziness (2% to 6%), anxiety (5%)

Dermatologic: Rash (4% to 7%), pruritus (3% to 6%), erythema (5%)

Endocrine & metabolic: Hypokalemia (9%), hyperkalemia (5%), hyperphosphatemia (3%)

Gastrointestinal: Nausea (6% to 10%), abdominal pain (6%), dyspepsia (1% to 4%), loose stool (4%), GI hemorrhage (2%)

Genitourinary: Urinary tract infection (2% to 7%)

Hematologic: INR increased (2%), eosinophilia (2%)

Hepatic: Transaminases increased (2% to 3%), alkaline phosphatase increased (2%)

Local: Injection site reaction (3% to 6%)

Neuromuscular & skeletal: CPK increased (3% to 9%), limb pain (2% to 9%), back pain (7%), weakness (5%), arthralgia (1% to 3%)

Renal: Renal failure (2% to 3%)

Respiratory: Pharyngolaryngeal pain (8%), pleural effusion (6%), cough (3%), pneumonia (3%), dyspnea (2% to 3%)

Miscellaneous: Osteomyelitis (6%), bacteremia (5%), diaphoresis (5%), sepsis (5%), infection (fungal, 2% to 3%)

<1%: Appetite decreased, arthralgia, atrial fibrillation, atrial flutter, cardiac arrest, dyskinesia, dysphagia, eczema, electrolyte disturbance, eosinophilia, erythema (truncal), eye irritation, fatigue, flatulence, flushing, GI discomfort, gingival pain, hallucination, hives, hypomagnesemia, hypersensitivity, hypoesthesia, jaundice, jitteriness, LDH increased, leukocytosis, lymphadenopathy, mental status change, muscle cramps, muscle weakness, myalgia, osteomyelitis, paresthesia, proteinuria, prothrombin time prolonged, rigors, serum bicarbonate increased, stomatitis, supraventricular arrhythmia, taste disturbance, thrombocytopenia, thrombocythemia, tinnitus, vertigo, vision blurred, xerostomia

Postmarketing and/or case reports: Anaphylaxis, rhabdomyolysis

Drug Interactions

HMG-CoA Reductase Inhibitors: May enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Test InteractionsDaptomycin may cause false prolongation of the PT and increase of INR with certain reagents. This appears to be a dose-dependent phenomenon. Therefore, it is recommended to obtain blood samples immediately prior to next daptomycin dose (eg, trough). If PT/INR elevated, clinicians should repeat PT/INR and evaluate for other causes of hypocoagulation.

Monitoring ParametersMonitor signs and symptoms of infection. CPK should be monitored at least weekly during therapy; more frequent monitoring if current or prior statin therapy, unexplained CPK increases, and/or renal impairment. Monitor for muscle pain or weakness, especially if noted in distal extremities.

Reference Range

Trough concentrations at steady-state:

4 mg/kg once daily: 5.9 ± 1.6 mcg/mL

6 mg/kg once daily: 6.7 ± 1.6 mcg/mL

Note: Trough concentrations are not predictive of efficacy/toxicity. Drug exhibits concentration-dependent bactericidal activity, so C_{max}:MIC ratios may be a more useful parameter.

Nursing: Physical Assessment/MonitoringUse caution in presence of myopathy. Assess potential for interactions with other pharmacological agents (eg, HMG-CoA reductase inhibitors). Assess results of laboratory tests (CPK), therapeutic effectiveness (eg, signs and symptoms of infection), and adverse reactions at beginning of therapy and on a regular basis during therapy. Should be infused over 30 minutes. Teach patient possible side effects and adverse symptoms to report (eg, rash, hypotension, CNS changes, limb pain, muscle pain or weakness, opportunistic infection).

Monitoring: Lab TestsCPK should be monitored at least weekly during therapy; more frequent monitoring if current or prior statin therapy, unexplained CPK increases, and/or renal impairment

Patient EducationThis medication can only be administered via intravenous infusion. You will be monitored during and after each infusion. Report immediately any burning, pain, or redness at infusion site, any throat tightness, respiratory difficulty, or chest tightness. Use caution when driving or engaging in tasks that require mental alertness until response to drug is known. Report unusual headache, insomnia, nausea or vomiting, persistent diarrhea, limb or joint pain, alteration in urination patterns, itching or pain on urination, or other possible adverse reactions. **Breast-feeding precaution:** Inform prescriber if you are or intend to breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Cubicin®: 500 mg

Generic AvailableNo

ManufacturerCubist Pharmaceutical, Inc

Mechanism of ActionDaptomycin binds to components of the cell membrane of susceptible organisms and causes rapid depolarization, inhibiting intracellular synthesis of DNA, RNA, and protein. Daptomycin is bactericidal in a concentration-dependent manner.

Pharmacodynamics/Kinetics

Distribution: 0.1 L/kg

Protein binding: 90% to 93%; 84% to 88% in patients with Cl_{cr}<30 mL/minute

Half-life elimination: 8-9 hours (up to 28 hours in renal impairment)

Excretion: Urine (78%; primarily as unchanged drug); feces (6%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia or dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause nausea, vomiting, and diarrhea; concurrent use with SSRIs may produce additive effects

Index TermsCidecin; Dapcin; LY146032

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Erythropoietin (Epogen®/Procrit®) and Darbepoetin (Aranesp®): Labeling Updates, Including Boxed Warning Revisions Regarding Use in Patients With Cancer - Updated September 2008

The U.S. Food and Drug Administration (FDA), Amgen Inc, and Ortho Biotech have issued a “Dear Health Care Professional” letter alerting practitioners of revised labeling for erythropoiesis-stimulating agents (ESAs) (epoetin alfa [Epogen®, Procrit®] and darbepoetin alfa [Aranesp®]). The labeling for these products has been updated, including changes to the indications, boxed warnings, and dosing reflecting that ESAs are not indicated for patients receiving myelosuppressive therapy when the anticipated outcome is curative and ESA therapy should not be initiated if the hemoglobin level is ≥10 g/dL. Medication guides have been developed to communicate the risks and benefits of ESAs for patients.

Prompted by information from studies on ESA use, over the last year there have been alerts, new labeling and/or “Dear Health Care Professional” letters issued regarding ESA use in both patients with cancer and patients with chronic renal failure. The studies in patients with cancer provided evidence of shortened time to tumor progression and increased mortality (decreased overall survival) in cancer patients (breast, cervical, head and neck, lymphoid, and nonsmall cell lung cancer) who received ESAs; however, in some studies, the ESA doses were targeted to maintain hemoglobin levels ≥12 g/dL. Based on this risk, as well as the risk of serious cardio- and thrombovascular events, labeling revisions have included recommendations from FDA advisory committees on appropriate ESA use in cancer and chronic renal failure patients and have consisted of expanded and/or strengthened boxed warnings, safety information, and revised dosing information. Practitioners are reminded that ESA use is only appropriate in the treatment of anemia in cancer patients due to concomitant chemotherapy, and therapy should be discontinued following completion of chemotherapy.

Boxed warning changes concerning use in chronic renal failure patients have included data from two studies showing an increased risk of death and serious cardiovascular events when ESAs were administered to achieve higher target hemoglobin compared with lower hemoglobin levels (13.5 vs 11.3 g/dL and 14 vs 10 g/dL). Dosing recommendations for chronic renal failure now specify a target hemoglobin range of 10-12 g/dL to achieve and maintain, including guidelines for increasing doses in patients not achieving recommended target hemoglobin range. Additional recommendations have been created for those patients unable to achieve the target hemoglobin range (despite appropriate titrations) with precautions against continuing to increase the dose and a consideration of ESA discontinuation.

The FDA Medwatch alerts and a link to the most recent “Dear Healthcare Professional” letter can be found at

http://www.fda.gov/medwatch/safety/2008/safety08.htm#ESA2

http://www.fda.gov/medwatch/safety/2008/safety08.htm#ESA

Medication Safety Issues

Sound-alike/look-alike issues:

Aranesp® may be confused with Aralast, Aricept®

Darbepoetin alfa may be confused with dalteparin, epoetin alfa, epoetin beta

Pronunciation(dar be POE e tin AL fa)

U.S. Brand NamesAranesp®

Canadian Brand NamesAranesp®

Pharmacologic CategoryColony Stimulating Factor; Growth Factor; Recombinant Human Erythropoietin

Use: Labeled IndicationsTreatment of anemia (elevate/maintain red blood cell level and decrease the need for transfusions) associated with chronic renal failure (including patients on dialysis and not on dialysis); treatment of anemia due to concurrent chemotherapy in patients with metastatic cancer (nonmyeloid malignancies)

Note: Darbepoetin is **not** indicated for use in cancer patients under the following conditions:

- receiving hormonal therapy, therapeutic biologic products, or radiation therapy unless also receiving concurrent myelosuppressive chemotherapy
- receiving myelosuppressive therapy when the expected outcome is curative

Use: Unlabeled/InvestigationalTreatment of symptomatic anemia in myelodysplastic syndrome (MDS)

Dosing: Adults**Note:** Hemoglobin levels should not exceed 12 g/dL and should not rise >1 g/dL per 2-week time period during therapy in any patient.

Anemia associated with CRF: Individualize dosing to achieve and maintain hemoglobin levels to a target range of 10-12 g/dL. Hemoglobin levels should not exceed 12 g/dL.

I.V., SubQ: Initial: 0.45 mcg/kg once weekly; alternative dose for nondialysis patients: 0.75 mcg/kg once every 2 weeks; Maintenance: titrate to maintain hemoglobin levels between 10-12 g/dL as described below (may be administered once weekly or every 2 weeks; nondialysis patients may require lower maintenance doses) **Note:** I.V. route is preferred in hemodialysis patients.

Dosage adjustment:

Decrease dose by ~25%: If hemoglobin approaches 12 g/dL **or** hemoglobin increases >1 g/dL in any 2-week period. If hemoglobin continues to increase, temporarily discontinue therapy until hemoglobin begins to decrease, then resume therapy with a ~25% reduction from previous dose.

Increase dose by ~25%: If hemoglobin does not increase by 1 g/dL after 4 weeks of therapy (with adequate iron stores). Do not increase dose more frequently than at 4-week intervals.

Inadequate or lack of response: If patient does not attain target hemoglobin range of 10-12 g/dL after appropriate dose titrations over 12 weeks:

Do not continue to increase dose and use the minimum effective dose that will maintain a hemoglobin level sufficient to avoid red blood cell transfusions **and** evaluate patient for other causes of anemia.

Monitor hemoglobin closely thereafter and if responsiveness improves, may resume making dosage adjustments as recommended above. If responsiveness does not improve and recurrent red blood cell transfusions continue to be needed, discontinue therapy.

Maintenance dose: Individualize to target hemoglobin range of 10-12 g/dL; limit additional dosage increase to every 4 weeks or longer. Patients generally require lower maintenance doses than initial doses to maintain target range.

Conversion from epoetin alfa: I.V., SubQ: Initial dose: Epoetin alfa doses may be converted to doses ranging from 6.25-200 mcg darbepoetin alfa per week (see conversion table below).

Anemia associated with chemotherapy: Titrate dosage to use the minimum effective dose that will maintain a hemoglobin level sufficient to avoid red blood cell transfusions. Do not initiate therapy if hemoglobin ≥10 g/dL. Discontinue darbepoetin following completion of chemotherapy.

SubQ: Initial: 2.25 mcg/kg once weekly **or** 500 mcg once every 3 weeks

Dosage adjustment:

Increase dose: If hemoglobin does not increase by 1 g/dL after 6 weeks of therapy (for patients receiving weekly therapy), the dose should be increased up to 4.5 mcg/kg once weekly

Decrease dose by 40%: If hemoglobin increases >1g/dL in any 2-week period **or** hemoglobin reaches a level sufficient to avoid red blood cell transfusion.

Withhold dose: If hemoglobin exceeds a level needed to avoid red blood cell transfusion. Resume treatment with a dose 40% below the previous dose when hemoglobin approaches a level where transfusions may be required.

Discontinue: On completion of chemotherapy or if after 8 weeks of therapy there is no hemoglobin response or transfusions still required

Anemia associated with MDS (unlabeled use): Adults: SubQ: 150-300 mcg once weekly

Conversion from epoetin alfa to darbepoetin alfa: See table.

Conversion From Epoetin Alfa to Darbepoetin Alfa (Initial Dose)

Previous Dosage of Epoetin Alfa (units/week)	**Children Darbepoetin Alfa Dosage (mcg/week)**	**Adults Darbepoetin Alfa Dosage (mcg/week)**
<1500	Not established	6.25
1500-2499	6.25	6.25
2500-4999	10	12.5
5000-10,999	20	25

11,000-17,999	40	40
18,000-33,999	60	60
34,000-89,999	100	100
≥90,000	200	200

Note: In patients receiving epoetin alfa 2-3 times per week, darbepoetin alfa is administered once weekly. In patients receiving epoetin alfa once weekly, darbepoetin alfa is administered once every 2 weeks. The darbepoetin dose to be administered every 2 weeks is derived by adding together 2 weekly epoetin alfa doses and then converting to the appropriate darbepoetin dose. Titrate dose to hemoglobin response thereafter.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Hemoglobin levels should not exceed 12 g/dL and should not rise >1 g/dL per 2-week time period during therapy in any patient.

Anemia associated with CRF: I.V. (preferred for hemodialysis patients), SubQ:

Children ≥1 year: Conversion from epoetin alfa: Initial dose: Epoetin alfa doses of 1500 to ≥90,000 units per week may be converted to doses ranging from 6.25-200 mcg darbepoetin alfa per week (see pediatric column in conversion table below).

Children 11-18 years: Initial treatment (unlabeled use): Initial dose: 0.45 mcg/kg once weekly; titrate to hemoglobin response

Anemia associated with chemotherapy: SubQ: Children (unlabeled use): 2.25 mcg/kg once weekly (discontinue following completion of chemotherapy course)

Dosage adjustment: Refer to adult dosing.

Dosing: Renal ImpairmentDosage requirements for patients with chronic renal failure who do not require dialysis may be lower than in dialysis patients. Monitor patients closely during the time period in which a dialysis regimen is initiated, dosage requirement may increase. The National Kidney Foundation Clinical Practice Guidelines for Anemia in Chronic Kidney Disease: 2007 Update of Hemoglobin Target (September, 2007) recommend hemoglobin levels in the range of 11-12 g/dL for dialysis and nondialysis patients receiving ESAs; hemoglobin levels should not be maintained >13 g/dL.

Hemodialysis: I.V. route is preferred in hemodialysis patients.

Calculations

- EPO to Aranesp

Administration: I.V.May be administered by I.V. injection. The I.V. route is recommended in hemodialysis patients. Do not shake; vigorous shaking may denature darbepoetin alfa, rendering it biologically inactive. Do not dilute or administer in conjunction with other drug solutions. Discard any unused portion of the vial; do not pool unused portions.

Administration: OtherMay be administered SubQ.

Dietary ConsiderationsSupplemental iron intake may be required in patients with low iron stores.

StorageStore at 2°C to 8°C (36°F to 46°F). Do not freeze or shake. Protect from light.

CompatibilityDo not dilute or administer with other solutions.

RestrictionsAn FDA-approved medication guide is available; distribute to each patient to whom this medication is dispensed.

ContraindicationsHypersensitivity to darbepoetin or any component of the formulation; uncontrolled hypertension

Warnings/Precautions

Boxed warnings:

- Cancer patients: See “Disease-related concerns” below.
- Cardiovascular events/mortality/thromboembolic events: See “Concerns related to adverse effects” below.
- Chronic renal failure patients: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Allergic reactions: Potentially serious allergic reactions have been reported, including rash and urticaria.
- Cardiovascular events/mortality/thromboembolic events: **[U.S. Boxed Warning]: ESAs increased the risk of serious cardiovascular events, thromboembolic events, and mortality** in clinical studies; a rapid rise in hemoglobin (>1 g/dL over 2 weeks) or maintaining higher hemoglobin levels may contribute to these risks.
- Pure red cell aplasia (PRCA): Cases of severe anemia and PRCA have been reported, predominantly in patients with CRF receiving SubQ darbepoetin (the I.V. route is preferred for hemodialysis patients). Patients with loss of response should be evaluated for pure red cell aplasia with associated neutralizing antibodies to erythropoietin; discontinue treatment in patients with PRCA secondary to neutralizing antibodies to erythropoietin. Antibodies may cross-react; do not switch to another ESA in patients who develop antibody-mediated anemia.

Disease-related concerns:

- Acute anemia: Due to the delayed onset of erythropoiesis, darbepoetin is of no value in the acute treatment of anemia.

- Cancer patients: **[U.S. Boxed Warning]: A shortened overall survival and/or increased risk of time-to-tumor progression or recurrence has been reported in studies with breast, cervical, head and neck, lymphoid, and nonsmall cell lung cancer patients.** It is of note that in these studies, patients received ESAs to a target hemoglobin of ≥12 g/dL; although risk has not been excluded when dosed to achieve a target hemoglobin of <12 g/dL. **[U.S. Boxed Warnings]: To decrease these risks, and risk of cardio- and thrombovascular events, use the lowest dose needed to avoid red blood cell transfusions. Use ESAs in cancer patients only for the treatment of anemia related to concurrent chemotherapy; discontinue ESA following completion of the chemotherapy course. ESAs are not indicated for patients receiving myelosuppressive therapy when the anticipated outcome is curative.**

- Chronic renal failure patients: **[U.S. Boxed Warning]: An increased risk of death and serious cardiovascular events was reported in patients administered ESAs to target higher versus lower hemoglobin levels (13.5 vs 11.3 g/dL; 14 vs 10 g/dL) in two clinical studies; dosing should be individualized to achieve and maintain hemoglobin levels within 10-12 g/dL range.** Hemoglobin rising >1 g/dL in a 2-week period may contribute to the risk. Chronic renal failure patients who exhibit an inadequate hemoglobin response to ESA therapy may be at a higher risk for cardiovascular events and mortality compared to other patients. ESA therapy may reduce dialysis efficacy (due to increase in red blood cells and decrease in plasma volume); adjustments in dialysis parameters may be needed.

- Hematologic diseases: Safety and efficacy in patients with underlying hematologic diseases have not been established, including porphyria, thalassemia, hemolytic anemia, and sickle cell disease.

- Hypertension/cardiovascular disease: Use with caution in patients with a history of hypertension. An excessive rate of rise of hemoglobin may be possibly associated with the exacerbation of hypertension; decrease the darbepoetin dose if the hemoglobin increase exceeds 1 g/dL in any 2-week period. Blood pressure should be controlled prior to start of therapy and monitored closely throughout treatment. Hypertensive encephalopathy has been reported with patients receiving erythropoietic therapy; monitor closely and control blood pressure

- Perisurgery patients: Increased mortality was observed in patients undergoing coronary artery bypass surgery who received epoetin; these deaths were associated with thrombotic events. An increased risk of DVT has been observed in patients treated with epoetin undergoing surgical orthopedic procedures. Darbepoetin is **not** approved for reduction in red blood cell transfusions in patients scheduled for surgical procedures.

- Seizures: Use with caution in patients with a history of seizures. An excessive rate of rise of hemoglobin may be possibly associated with the exacerbation of seizures; decrease the darbepoetin dose if the hemoglobin increase exceeds 1 g/dL in any 2-week period.

Special populations:

- Pediatrics: Safety and efficacy in children with cancer have not been established; children >1 year of age with CRF have been converted from epoetin alfa to darbepoetin.

Dosage form specific issues:

- Albumin: Product may contain albumin, which confers a theoretical risk of transmission of viral disease or Creutzfeldt-Jakob disease.

- Autoinjectors: Autoinjectors are designed to deliver entire contents; do not use if partial contents are required for dose (use prefilled syringe or vial).

- Latex: The packaging of some formulations may contain latex.

Other warnings/precautions:

- Acute correction: Not recommended for acute correction of severe anemia or as a substitute for transfusion.

- Appropriate use: Hemoglobin levels should not exceed a target range of 10-12 g/dL and should not rise >1 g/dL per 2-week time period during therapy in any patient.

- Factors impairing erythropoiesis: Prior to treatment, correct or exclude deficiencies of iron, vitamin B_{12}, and/or folate, as well as other factors which may impair erythropoiesis (aluminum toxicity, inflammatory conditions, infections). Poor response to therapy should prompt evaluation of potential factors impairing erythropoiesis, as well as possible malignant processes, occult blood loss, hemolysis, and/or bone marrow fibrosis.

- Iron supplementation: Prior to and during therapy, iron stores must be evaluated. Supplemental iron is recommended if serum ferritin <100 mcg/L or serum transferrin saturation <20%.

Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Darbepoetin alfa should be used in a pregnant woman only if potential benefit justifies the potential risk to the fetus.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Cardiovascular: Edema (21%), hypertension (4% to 20%), hypotension (20%)

Central nervous system: Fatigue (9% to 33%), fever (4% to 19%), headache (12% to 16%), dizziness (7% to 14%)

Gastrointestinal: Diarrhea (14% to 22%), constipation (5% to 18%), vomiting (2% to 14%), nausea (11%)

Neuromuscular & skeletal: Muscle spasm (17%), arthralgia (9% to 13%)

Respiratory: Upper respiratory infection (15%)

Miscellaneous: Infection (24%)

1% to 10%:

Cardiovascular: Peripheral edema (10%), arrhythmia/arrest (8%), angina/chest pain (7% to 8%), fluid overload (6%), thrombosis (6%), CHF (5%), MI (2%)

Central nervous system: Stroke (2%), seizure (≤1%), TIA (≤1%)

Dermatologic: Rash (7%), pruritus (6%)

Endocrine & metabolic: Dehydration (3% to 5%)

Gastrointestinal: Abdominal pain (10%)

Local: Vascular access hemorrhage (7%), injection site pain (6%), vascular access infection (6%), vascular access thrombosis (6%)

Neuromuscular & skeletal: Limb pain (8%), myalgia (8%), back pain (7%), weakness (5%)

Respiratory: Dyspnea (2% to 10%), cough (9%), bronchitis (5%), pneumonia (3%), pulmonary embolism (1%)

Miscellaneous: Death (7% to 10 %; similar to placebo), flu-like syndrome (6%)

<1%, postmarketing, and/or case reports: Abscess, allergic reaction, bacteremia, deep vein thrombosis, GI hemorrhage, hypertensive encephalopathy, peritonitis, pure red cell aplasia (PRCA), sepsis, severe anemia (with or without other cytopenias), thromboembolism, thrombophlebitis, thrombosis, tumor progression (cancer patients)

Oncology: VesicantNo
Oncology: Emetic PotentialLow (10% to 30%)
Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb InteractionsEthanol: Should be avoided due to adverse effects on erythropoiesis.
Monitoring ParametersHemoglobin (at least once per week until maintenance dose established and after dosage changes; monitor at regular intervals at least once per month once hemoglobin is stabilized); iron stores (transferrin saturation and ferritin) prior to and during therapy; serum chemistry (CRF patients); blood pressure
Nursing: Physical Assessment/MonitoringEvaluate history of hypertension or seizures and potential risk for thromboembolism prior to beginning therapy. Blood pressure should be monitored closely and controlled during therapy. If administered by intravenous infusion, lines should be monitored closely for possible clotting. Assess results of laboratory tests prior to and on a regular scheduled basis during therapy (eg, blood chemistries, hemoglobin/hematocrit, serum ferritin, transferrin saturation). Evaluate therapeutic effectiveness (according to purpose for use) and adverse response on a frequent basis during therapy (eg, hyper-/hypotension, edema, thrombosis, stroke, TIA, anemia). Teach patient proper use if self-administered (appropriate SubQ injection technique and syringe/needle disposal), possible side effects/appropriate interventions (importance of maintaining laboratory schedule), and adverse symptoms to report.
Monitoring: Lab TestsHemoglobin (at least once per week until maintenance dose established and after dosage changes; monitor at regular intervals at least once per month once hemoglobin is stabilized); iron stores (transferrin saturation and ferritin) prior to and during therapy; serum chemistry (CRF patients)
Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy unless approved by prescriber. If self-administered, follow exact directions for injection and needle disposal. You will require frequent blood tests to determine appropriate dosage and reduce potential for severe adverse effects; maintaining laboratory testing schedule is vital. Do not make significant changes in your dietary iron without consulting prescriber. You may experience fever; headache; trouble sleeping; itching; skin pain; nausea; and/or vomiting, diarrhea, heartburn, and upper respiratory congestion. Contact prescriber if symptoms persist. Report signs or symptoms of edema (eg, swollen extremities, respiratory difficulty, rapid weight gain); onset of severe headache, unusual dizziness, or blurred vision; chest pain; leg pain and tenderness; muscular tremors or seizure activity; difficulty breathing, coughing, or congestion; or other adverse effects.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Mechanism of ActionInduces erythropoiesis by stimulating the division and differentiation of committed erythroid progenitor cells; induces the release of reticulocytes from the bone marrow into the bloodstream, where they mature to erythrocytes. There is a dose response relationship with this effect. This results in an increase in reticulocyte counts followed by a rise in hematocrit and hemoglobin levels. When administered SubQ or I.V., darbepoetin's half-life is ~3 times that of epoetin alfa concentrations.

Pharmacodynamics/Kinetics

Onset of action: Increased hemoglobin levels not generally observed until 2-6 weeks after initiating treatment

Absorption: SubQ: Slow

Distribution: V_d: 0.06 L/kg

Bioavailability: CRF: SubQ: Adults: ~37% (range: 30% to 50%); Children: 54% (range: 32% to 70%)

Half-life elimination:

- CRF: Adults:
  - I.V.: 21 hours
  - SubQ: Nondialysis patients: 70 hours (range: 35-139 hours); Dialysis patients: 46 hours (range: 12-89 hours)
- Cancer: Adults: SubQ: 74 hours (range: 24-144 hours); Children: 49 hours
- **Note:** Darbepoetin half-life is approximately threefold longer than epoetin alfa following I.V. administration

Time to peak: SubQ:

- CRF: Adults: 48 hours (range: 12-72 hours; independent of dialysis); Children: 36 hours (range: 10-58 hours)
- Cancer: Adults: 71-90 hours (range: 28-123 hours); Children: 71 hours (range: 21-143 hours)

Pharmacotherapy Pearls**Oncology Comment:** The American Society of Hematology (ASH) and American Society of Clinical Oncology (ASCO) 2007 updates to the clinical practice guidelines for the use of erythropoiesis-stimulating agents (ESAs) indicate that ESAs are most appropriate when used according to the dosage parameters within the Food and Drug Administration (FDA) approved labeling for epoetin and darbepoetin (Rizzo, 2008). While the previous guidelines addressed only the use of epoetin, the 2007 guidelines also address the use of darbepoetin, which is assessed as being equivalent to epoetin with respect to safety and efficacy. When used as an option for the treatment of chemotherapy-associated anemia (to increase hemoglobin and decrease red blood cell transfusions), therapy with ESAs should begin as the hemoglobin level approaches or falls below 10 g/dL. The ASH/ASCO guidelines recommend following the FDA approved dosing (and dosing adjustment) guidelines and target hemoglobin ranges as alternate dosing and schedules have not demonstrated consistent differences in effectiveness with regard to hemoglobin response. In patients who do not have a response within 6-8 weeks (hemoglobin rise <1-2 g/dL or no reduction in transfusions) ESA therapy should be discontinued.

The guidelines note that patients with an increased risk of thromboembolism (generally includes previous history of thrombosis, surgery, and/or prolonged periods of immobilization) and patients receiving concomitant medications that may increase thromboembolic risk, should begin ESA therapy only after careful consideration. With the exception of low-risk myelodysplasia-associated anemia (which has evidence supporting the use of ESAs without concurrent chemotherapy), the guidelines do not support the use of ESAs in the absence of concurrent chemotherapy.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation or dizziness

Mental Health: Effects on Psychiatric TreatmentNausea, vomiting, and diarrhea are common; use caution with lithium, valproic acid, and SSRIs

Cardiovascular Considerations

Anemia in Chronic Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines suggest that the benefit of enhancing erythropoiesis in these patients is not established. Although some small studies have shown a benefit from erythropoietin and iron in mild anemia in heart failure, further investigation is required evaluating the risks and benefits. Additionally, darbepoetin has also been evaluated in small numbers of patients with chronic heart failure (Parissis, 2008; van Veldhuisen, 2007); however, larger trials are required to determine the safety and efficacy of darbepoetin in this patient population.

Anesthesia and Critical Care Concerns/Other Considerations

Routine Use in Critically-Ill Patients

A prospective, randomized, double-blind, placebo-controlled, multicenter trial was performed with critically-ill patients assessing the efficacy of recombinant human erythropoietin in reducing red blood cell transfusions (Corwin, 2002). Patients were enrolled from December,1998 through June, 2001. Over 1300 ICU (medical, surgical, or medical/surgical) patients were randomized to receive placebo or 40,000 units of erythropoietin subcutaneously on ICU day 3 and then weekly for a total of 3 doses for patients who remained in the hospital. Inclusion criteria included ICU stay for 3 days, age >18 years, and hematocrit <38%. Exclusion criteria were extensive and included acute ischemic heart disease, acute gastrointestinal bleed, and renal failure with hemodialysis. Each patient's physician determined the need for red blood cell transfusion. Results: The mean baseline hemoglobin was 9.97 g/dL in each group. Patients receiving erythropoietin were less likely to receive transfusions. The median number of units transfused per patient in the placebo group was 2 and in the erythropoietin group was 1 (p<0.001). The erythropoietin group had a 9.9% absolute reduction in RBC transfusions during 28 days (p<0.001, OR 0.67, CI 0.54-0.83). Mortality and adverse clinical events were not significantly different between groups. The authors concluded that weekly administration of erythropoietin in critically-ill patients reduces red blood cell transfusions and increases hemoglobin. The authors also suggest that further study is needed to determine if use of erythropoietin results in improved clinical outcomes.

A restrictive transfusion trial was published after the above Corwin trial was underway (Hebert, 1999). Hebert and his group evaluated a restrictive transfusion strategy (transfuse if hemoglobin <7 g/dL to maintain between 7 and 9 g/dL) versus a liberal strategy (transfuse if hemoglobin <10 g/dL to maintain between 10 and 12 g/dL). Inclusion criteria included anticipated ICU stay >24 hours, hemoglobin ≤9 g/dL with 72 hours of ICU admission, and euvolemia after initial treatment. Exclusion criteria included chronic anemia, active bleeding, or admission after a routine cardiac surgical procedure. The restrictive approach to transfusion was at least as effective as and possibly superior to a liberal transfusion policy in critically-ill patients. The exception to this may be patients with acute myocardial infarction and unstable angina.

More recently, Corwin, et al (2007) once again evaluated the use of recombinant human erythropoietin in the critically ill. In this prospective, randomized, placebo-controlled trial, 1460 medical, surgical, or trauma patients were enrolled between December, 2003 and June, 2006. Patients received either subcutaneous erythropoietin 40,000 units or placebo once weekly for a maximum of 3 doses and were followed for 140 days. The primary endpoint of the study was the percentage of patients who received a red cell transfusion between days 1 and 29. Secondary endpoints included the number of red cell units transfused between days 1 and 29, mortality at day 29 and day 140, and the change in hemoglobin concentration from baseline to day 29. Patients were evaluated for inclusion into the study if they remained in that ICU for 2 days. Inclusion criteria were age >18 years and hemoglobin concentration <12 g/dL. Exclusion criteria were extensive and included acute ischemic heart disease during the ICU stay, acute gastrointestinal bleed, hemodialysis, and patients at risk for thrombosis (history of pulmonary embolism, deep venous thrombosis, ischemic stroke, other arterial or venous thrombosis). Red cell transfusions targeted hemoglobin concentrations between 7 and 9 g/dL, but the need for transfusion was determined by the treating physician (this is more consistent with clinical practice after the Hebert trial was published and different than the previous Corwin trial). Results: The mean baseline hemoglobin for each group was 9.6 g/dL. The use of erythropoietin did not significantly decrease the need for red cell transfusion (46.0% in the erythropoietin group transfused vs 48.3% in the placebo group, p=0.34). The hemoglobin concentration at day 29 increased more in the erythropoietin group compared to placebo (1.6 ± 2.0 g/dL vs 1.2 ± 1.8 g/dL, p<0.001); however, by day 42 the hemoglobin concentrations in both groups were similar. Mortality at day 29 was significantly lower in the group receiving erythropoietin (8.5% vs 11.4%, p=0.02) from the Kaplan-Meier estimate, but no difference was seen in the Cox model in the overall population. Only in the trauma subset was mortality at day 29 significantly lower in the erythropoietin group (3.5% vs 6.6%, p=0.04). At day 140, mortality was not significantly lower in the erythropoietin group. Thrombotic events (eg, DVT and myocardial infarction) were significantly higher in the erythropoietin group as compared to placebo and appeared to be dose-related (16.5% vs 11.5%, p=0.008, HR 1.41, CI 1.06-1.86). However, upon further analysis those patients who did not receive heparin at baseline developed these events more frequently. There was no difference in length of stay or the use of mechanical ventilation between groups. The authors concluded that although erythropoietin does not reduce the incidence of red cell transfusion in critically-ill patients, it may reduce mortality in trauma patients. Further investigation is required to define erythropoietin’s role in this population. The routine use of erythropoietin in critically-ill, nontraumatic surgical or medical patients is not supported by this study.

The 2008 Surviving Sepsis Campaign guidelines do not recommend erythropoietin as a treatment for anemia associated with severe sepsis but suggest that it may be used when septic patients have other therapeutic indications (Grade 1B).

Pronunciation(dar i FEN a sin)

U.S. Brand NamesEnablex®

Canadian Brand NamesEnablex®

Pharmacologic CategoryAnticholinergic Agent

Use: Labeled IndicationsManagement of symptoms of bladder overactivity (urge incontinence, urgency, and frequency)

Dosing: Adults

Symptoms of bladder overactivity: Oral: Initial: 7.5 mg once daily. If response is not adequate after a minimum of 2 weeks, dosage may be increased to 15 mg once daily.

Dosage adjustment with concomitant potent CYP3A4 inhibitors (eg, azole antifungals, erythromycin, isoniazid, protease inhibitors): Daily dosage should not exceed 7.5 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment required.

Dosing: Hepatic Impairment

Moderate impairment (Child-Pugh class B): Daily dosage should not exceed 7.5 mg/day

Severe impairment (Child-Pugh class C): Has not been evaluated; use is not recommended

Administration: OralTablet should be taken with liquid and swallowed whole; do not chew, crush or split tablet. May be taken without regard to food.

Dietary ConsiderationsMay be taken without regard to meals, with or without food.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsHypersensitivity to darifenacin or any component of the formulation; uncontrolled narrow-angle glaucoma; urinary retention, paralytic ileus, GI or GU obstruction

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.

Disease-related concerns:

- Gastrointestinal disease: Use with caution in patients with decreased GI motility, constipation, hiatal hernia, reflux esophagitis, and ulcerative colitis; may decrease GI motility.
- Glaucoma: In patients with controlled narrow-angle glaucoma, darifenacin should be used with extreme caution and only when the potential benefit outweighs risks of treatment.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage limitation is required in moderate hepatic impairment (Child-Pugh class B). Not recommended for use in severe hepatic impairment (Child-Pugh class C).
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may decrease GI motility.
- Prostatic hyperplasia/bladder outlet obstruction: Use with caution in patients with prostatic hyperplasia (nonobstructive) or clinically-significant bladder outlet obstruction; may increase risk of urinary retention.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors (see Drug Interactions); dosage limitation of darifenacin is required.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsThere is a trend for decreased clearance with age, though no change in dose is recommended. The selectivity of darifenacin for the M3 receptor on the bladder may offer an advantage (less CNS and cardiovascular effects) over other anticholinergic agents used in the treatment of overactive bladder.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects and developmental delay were observed in some animal studies. There are no adequate and well-controlled studies in pregnant women; should be used only if potential benefit outweighs possible risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsAlthough human data are not available, darifenacin is excreted in the breast milk in animals.

Adverse Reactions

>10%: Gastrointestinal: Xerostomia (19% to 35%), constipation (15% to 21%)

1% to 10%:

Cardiovascular: Hypertension, peripheral edema

Central nervous system: Headache (7%), dizziness (1% to 2%), pain

Dermatological: Dry skin, pruritus, rash

Gastrointestinal: Dyspepsia (3% to 8%), abdominal pain (2% to 4%), nausea (2% to 4%), diarrhea (1% to 2%), vomiting, weight gain

Genitourinary: Urinary tract infection (4% to 5%), urinary retention, urinary tract disorder, vaginitis

Neuromuscular & skeletal: Weakness (2% to 3%), arthralgia, back pain

Ocular: Dry eyes (2%), abnormal vision

Respiratory: Bronchitis, pharyngitis, rhinitis, sinusitis

Miscellaneous: Flu-like syndrome (1% to 3%), accidental injury (1% to 3%)

Postmarketing and/or case reports: Angioedema, confusion, hallucinations, hypersensitivity reactions

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor), CYP3A4 (major); **Inhibits** CYP2D6 (moderate), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Darifenacin serum concentration may be decreased by St John's wort (avoid concurrent use.)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Monitor therapeutic effectiveness and adverse reactions. Teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake as directed. Swallow tablet whole. May cause headache (consult prescriber for a mild analgesic); dizziness, nervousness, or sleepiness (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); or abdominal discomfort, diarrhea, constipation (increasing exercise, fluids, fruit/fiber may help); dry mouth, nausea, vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report back pain, muscle spasms, alteration in gait, or numbness of extremities; unresolved or persistent constipation, diarrhea, or vomiting; or symptoms of upper respiratory infection or flu. Report difficulty urinating, or pain on urination, or abdominal pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if considering breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, extended release: 7.5 mg, 15 mg

Generic AvailableNo

ManufacturerNovartis

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Enablex)

7.5 mg (30): $120.98

15 mg (30): $123.98

Mechanism of ActionSelective antagonist of the M3 muscarinic (cholinergic) receptor subtype. Blockade of the receptor limits bladder contractions, reducing the symptoms of bladder irritability/overactivity (urge incontinence, urgency and frequency).

Pharmacodynamics/Kinetics

Distribution: V_{dss}: ~163 L

Protein binding: ~98% (primarily alpha$_1$-acid glycoprotein)

Metabolism: Hepatic, via CYP3A4 (major) and CYP2D6 (minor)

Bioavailability: 15% to 19%

Half-life elimination: ~13-19 hours

Time to peak, plasma: ~7 hours

Excretion: As metabolites (inactive); urine (60%), feces (40%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Prolonged xerostomia may contribute to discomfort and dental disease (eg, caries, periodontal disease, and oral candidiasis).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentConcomitant use with acetylcholinesterase inhibitors will mitigate their clinical effects. Concomitant use with psychotropic agents may produce additive anticholinergic effects. Darifenacin may increase levels of fluoxetine, mirtazapine, nefazodone, paroxetine, risperidone, thioridazine, TCAs, and venlafaxine.

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Cisplatin: I.V.: 25 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 75 mg/m^2]

Dacarbazine: I.V.: 220 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 660 mg/m^2]

Carmustine: I.V.: 150 mg/m^2 day 1 (every other cycle)

[total dose/cycle = 150 mg/m^2; every other cycle]

Tamoxifen: Oral: 10 mg twice daily (begin 1 week before chemotherapy)

[total dose/cycle = 420 mg]

Repeat cycle every 21 days

Variation 2:

Carmustine: I.V.: 150 mg/m^2 day 1

[total dose/cycle = 150 mg/m^2]

Cisplatin: I.V.: 25 mg/m^2/day days 1, 2, 3, 22, 23, and 24

[total dose/cycle = 150 mg/m^2]

Dacarbazine: I.V.: 220 mg/m^2/day days 1, 2, 3, 22, 23, and 24

[total dose/cycle = 1320 mg/m^2]

Tamoxifen: Oral: 10 mg twice daily days 1 to 42

[total dose/cycle = 840 mg]

Repeat cycle every 42 days

Variation 3:

Carmustine: I.V.: 150 mg/m^2 day 1

[total dose/cycle = 150 mg/m^2]

Cisplatin: I.V.: 25 mg/m^2/day days 1, 2, 3, 22, 23, and 24

[total dose/cycle = 150 mg/m^2]

Dacarbazine: I.V.: 220 mg/m^2/day days 1, 2, 3, 22, 23, and 24

[total dose/cycle = 1320 mg/m^2]

Tamoxifen: Oral: 160 mg/day days -6 to 0 (cycle 1 only)

[total dose/cycle = 1120 mg]

followed by Oral: 40 mg/day days 1 to 42

[total dose/cycle = 1680 mg]

Repeat cycle every 42 days

Variation 4:

Carmustine: I.V.: 150 mg/m^2 day 1

[total dose/cycle = 150 mg/m^2]

Cisplatin: I.V.: 25 mg/m^2/day days 1, 2, 3, 29, 30, and 31

[total dose/cycle = 150 mg/m^2]

Dacarbazine: I.V.: 220 mg/m^2/day days 1, 2, 3, 29, 30, and 31

[total dose/cycle = 1320 mg/m^2]

Tamoxifen: Oral: 10-20 mg twice daily days 1 to 56

[total dose/cycle = 1120-2240 mg]

Repeat cycle every 56 days

Variation 5:

Cisplatin: I.V.: 25 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 75 mg/m^2]

Dacarbazine: I.V.: 220 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 660 mg/m^2]

Carmustine: I.V.: 100 mg/m^2 day 1 (give in cycles 1, 3, and 6 **only**)

[total dose/cycles 1, 3, and 6 = 100 mg/m^2]

Tamoxifen: Oral: 160 mg loading dose immediately before cycle 1

[total dose/loading dose + cycle 1 = 580 mg]

followed by Oral: 20 mg daily days 1 to 21

[total dose/subsequent cycles = 420 mg]

Repeat cycle every 21 days

Note: Tamoxifen is continued until 3 weeks after last cycle.

Special Alerts

Hepatotoxicity Associated With Darunavir/Ritonavir Combination - March 13, 2008; Updated May 2008

Tibotec Therapeutics, in conjunction with the U.S. Food and Drug Administration (FDA) and Health Canada, are notifying their respective healthcare professionals of changes to the labeling of darunavir (Prezista®) emphasizing the risk of hepatotoxicity. Use of darunavir/ritonavir during clinical development has been associated with infrequent cases of drug-induced hepatitis. Postmarketing surveillance has confirmed evidence of liver injury, with some fatalities. These events have generally occurred in conjunction with advanced HIV disease (and multiple concomitant medications), hepatitis B or C coinfection and/or immune reconstitution syndrome. Patients' transaminases should be monitored prior to, and during therapy with darunavir/ritonavir. Increased vigilance of monitoring is warranted in patients with risk factors (eg, underlying chronic hepatitis, cirrhosis, previous abnormal liver function tests). Any evidence of new-onset or worsening liver function should prompt interruption or discontinuation of darunavir therapy.

Additional information including a copy of the Dear Healthcare Professional letter can be found at

U.S.: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Prezista.

Canada: http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/2008/prezista_hpc-cps_e.html

Pronunciation(dar OO na veer)
U.S. Brand NamesPrezista®
Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor
Use: Labeled IndicationsTreatment of HIV-1 infections in combination with ritonavir and other antiretroviral agents
Dosing: Adults**Treatment of HIV infection:** Oral:

Therapy-naive: 800 mg once daily with food; coadministration with ritonavir 100 mg once daily is required.

Therapy-experienced: 600 mg twice daily with food; coadministration with ritonavir 100 mg twice daily is required.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment required for mild to moderate impairment. No data available for use in severe renal failure or end-stage renal disease.
Dosing: Hepatic ImpairmentNo adjustment for mild-to-moderate impairment. Not recommended for patients with severe impairment.
Dosing: Adjustment for Toxicity

Severe rash: Discontinue treatment.

New or worsening liver dysfunction: Consider interrupting or discontinuing treatment.

Administration: OralAdminister with food (bioavailability is increased). Coadministration with ritonavir is required.
Dietary ConsiderationsAbsorption increased with food. Take with meals.
StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).
ContraindicationsCoadministration with medications highly dependent upon CYP3A4 for clearance and for which increased levels are associated with serious and/or life-threatening events (includes cisapride, ergot alkaloids (eg, dihydroergotamine, ergonovine, ergotamine, methylergonovine), lovastatin, midazolam (oral), pimozide, rifampin, simvastatin, St John's wort, triazolam)
Allergy Considerations

- Darunavir Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hepatotoxicity: Infrequent cases of drug-induced hepatitis (including acute and cytolytic) have been reported. Liver injury has been reported with use (including some fatalities), though generally in patients on multiple medications, with advanced HIV disease, hepatitis B/C coinfection, and/or immune reconstitution syndrome. Monitor patients closely; consider interrupting or discontinuing therapy if signs/symptoms of liver impairment occur.
- Hypersensitivity reactions: Protease inhibitors have been associated with a variety of hypersensitivity events (some severe), including rash, anaphylaxis (rare), angioedema, bronchospasm, erythema multiforme, and/or Stevens-Johnson syndrome (rare). It is generally

recommended to discontinue treatment if severe rash or moderate symptoms accompanied by other systemic symptoms occur.

- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

- Increased cholesterol: Increases in total cholesterol and triglycerides have been reported; screening should be done prior to therapy and periodically throughout treatment.

- Sulfonamide allergy: Use with caution in patients with sulfonamide allergy (contains sulfa moiety).

Disease-related concerns:

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.

- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding during protease inhibitor therapy has been reported.

- Hepatic impairment: May exacerbate pre-existing hepatic dysfunction; use with caution in patients with underlying hepatic disease, such as hepatitis B or C or cirrhosis. Not recommended in severe impairment.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Ritonavir: Coadministration with ritonavir is required. Treatment history and resistance data should guide use of darunavir with ritonavir.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIt is not known if darunavir crosses the human placenta. No teratogenicity has been demonstrated in animal studies. However, there are no adequate and well-controlled studies in pregnant women. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. Women receiving estrogen (as hormonal contraception or replacement therapy) have an increased incidence of rash. Alternative forms of contraception may be needed. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsAs a class, protease inhibitors potentially cause dyslipidemias which includes elevated cholesterol and triglycerides and a redistribution of body fat centrally to cause increased abdominal girth, buffalo hump, facial atrophy, and breast enlargement. These agents also cause hyperglycemia. Frequency of adverse events is reported for darunavir/ritonavir. See also Ritonavir monograph.

>10%:

Endocrine & metabolic: Hypercholesterolemia (grade 2: 12% to 24%; grade 3: 1% to 8%), LDL increased (grade 2: 11% to 13%; grade 3: 2% to 7%), triglycerides increased (grade 2: 2% to 11%; grade 3: 1% to 7%; grade 4: ≤2%)

Gastrointestinal: Diarrhea (6% to 12%)

Hematologic: Neutropenia (7% to 12%)

Respiratory: Nasopharyngitis (14%)

2% to 10%:

Central nervous system: Headache (2% to 5%)

Dermatologic: Rash (2% to 10%)

Endocrine & metabolic: Hyperglycemia (grade 2: 6% to 8%; grade 3: ≤1%; grade 4: <1%), hypoglycemia (2% to 4%), hypocalcemia (up to 4%), hyponatremia (1% to 3%), hypernatremia (up to 2%)

Gastrointestinal: Nausea (3% to 7%), amylase increased (grade 2: 4% to 6%; grade 3: 3% to 6%), abdominal pain (4% to 5%), vomiting (2% to 4%), abdominal distention (≤2%), dyspepsia (≤2%), lipase increased (grade 2: 2%; grade 3: ≤2%; grade 4: <1%)

Hematologic: Thromboplastin time increased (4% to 8%), hypoalbuminemia (3% to 4%), prothrombin time increased (1% to 4%), thrombocytopenia (3%)

Hepatic: ALT increased (grade 2: 5% to 6%, grade 3: 2% to 3%; grade 4: ≤1%), AST increased (grade 2: 4% to 6%; grade 3: 2% to 3%; grade 4: <1%)

Neuromuscular & skeletal: Weakness (≤3%)

<2%: Acute renal failure, alkaline phosphatase increased, allergic dermatitis, alopecia, anorexia, anxiety, appetite decreased, arthralgia, confusion, cough, dermatitis medicamentosa, diabetes mellitus, disorientation, dreams abnormal, dyspnea, erythema multiforme, extremity pain; fat redistribution (eg, buffalo hump, increased abdominal girth, breast engorgement, facial atrophy); fatigue, fever,

flatulence, folliculitis, hepatitis (acute and cytolytic), gynecomastia, hiccups, hyperbilirubinemia, hyperhidrosis, hyperlipidemia, hypertension, hyperthermia, hypoesthesia, immune reconstitution syndrome, irritability, lipoatrophy, maculopapular rash, memory impairment, MI, mood changes, myalgia, nephrolithiasis, night sweats, nightmare, obesity, osteopenia, osteoporosis, pancreatitis, paresthesia, peripheral edema, peripheral neuropathy, polydipsia, polyuria, pruritus, renal insufficiency, rigors, skin inflammation, somnolence, Stevens-Johnson syndrome, tachycardia, toxic skin eruption, transient ischemic attack, vertigo, xerostomia

Postmarketing and/or case reports: Hypersensitivity reactions (including facial edema), rhabdomyolysis (coadministration with HMG-CoA reductase inhibitors)

Metabolism/Transport Effects **Substrate** of CYP3A4 (major); **Inhibits** P-glycoprotein

Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP2D6 Substrates: Darunavir may increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Protease Inhibitors may decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Didanosine: Darunavir may decrease the serum concentration of Didanosine. More specifically, this interaction is likely due to the effects of food (with which darunavir/ritonavir are taken) on didanosine, which is supposed to be given on an empty stomach. Management: Didanosine should be administered 1 hour prior to or 2 hours after administration of darunavir/ritonavir (which must be taken with food). *Risk D: Consider therapy modification*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

Efavirenz: Darunavir may increase the serum concentration of Efavirenz. Efavirenz may decrease the serum concentration of Darunavir. *Risk C: Monitor therapy*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

Etravirine: Protease Inhibitors may decrease the serum concentration of Etravirine. This effect is anticipated with darunavir & saquinavir (with low-dose ritonavir). Etravirine may increase the serum concentration of Protease Inhibitors. This effect is anticipated with nelfinavir. Protease Inhibitors may increase the serum concentration of Etravirine. This is expected with lopinavir/ritonavir. Management: Low-dose ritonavir boosting MUST be used when these protease inhibitors are used with etravirine. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Lidocaine: Darunavir may increase the serum concentration of Lidocaine. *Risk C: Monitor therapy*

Lopinavir: May decrease the serum concentration of Darunavir. Darunavir may increase the serum concentration of lopinavir *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Methadone: Protease Inhibitors may decrease the metabolism of Methadone. *Risk C: Monitor therapy*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Norethindrone: Darunavir may decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

PARoxetine: Darunavir may decrease the serum concentration of PARoxetine. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

PHENobarbital: May decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Phenytoin: May decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Saquinavir: May decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Sertraline: Darunavir may decrease the serum concentration of Sertraline. *Risk C: Monitor therapy*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Protease Inhibitors. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tenofovir: May decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

Theophylline Derivatives: Protease Inhibitors may decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Voriconazole: Darunavir may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Warfarin: Darunavir may decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Bioavailability is increased with a high-fat meal.

Herb/nutraceutical: St John’s wort may decrease the plasma levels of darunavir (concomitant use not recommended).

Monitoring ParametersViral load, CD4, serum glucose; transaminase levels prior to and during therapy (increase monitoring in patients at risk for liver impairment), cholesterol, triglycerides

Nursing: Physical Assessment/MonitoringUse caution in presence of, or at risk for, hepatic impairment. Assess other pharmacologic or herbal products patient may be taking for potential interactions or toxicity; (multiple liver enzyme interactions may increase or decrease levels/effects drugs and increase potential for toxicity or loss of effectiveness) dosing adjustments may be necessary. Evaluate results of laboratory tests (CD4 count, viral load, transaminase levels, and serum glucose) prior to and at regular intervals during therapy. Assess for adverse reactions (eg, gastrointestinal disturbance [nausea, vomiting, diarrhea] that can lead to dehydration and weight loss, hyperlipidemia and redistribution of body fat). Caution patients with diabetes to monitor glucose levels closely; protease inhibitors may cause hyperglycemia or new-onset diabetes. Teach patient proper use (eg, timing of multiple medications), possible side effects/appropriate interventions (eg, glucose testing), and adverse symptoms to report.

Monitoring: Lab TestsViral load, CD4, serum glucose; transaminase levels prior to and during therapy (increase monitoring in patients at risk for liver impairment), cholesterol, triglycerides

Patient EducationInform prescriber of all medications and over-the-counter products you are currently taking and do not take any new prescription or over-the-counter medications, or herbal products during therapy without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multi drug combination; take exactly as directed, for full course of therapy. Take with food (type of food is not important). Swallow tablets whole with a drink of water or milk. Do not chew tablets. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. You may be advised to check your glucose levels (this drug can cause hyperglycemia). May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (boiled milk, buttermilk, or yogurt may help); headache (consult prescriber for approved analgesic) Inform prescriber if you experience unresolved persistent vomiting, diarrhea, or abdominal pain; respiratory difficulty or chest pain; unusual bleeding or skin rash; or any persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. If using contraceptive consult prescriber for approved contraceptive. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Prezista®: 300 mg, 400 mg, 600 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Prezista)

300 mg (120): $919.96

Mechanism of ActionDarunavir binds to the HIV-1 protease activity site and inhibits the activity of the enzyme. HIV protease is required for the cleavage of viral Gag-Pol polyprotein precursors into individual functional proteins found in infectious HIV. Inhibition prevents cleavage of these polyproteins, resulting in the formation of immature, noninfectious viral particles.
Pharmacodynamics/KineticsAll kinetic parameters derived in the presence of ritonavir coadministration.

Absorption: Increased 30% with food

Protein binding: ~95%

Metabolism: Hepatic, via CYP3A4 to minimally-active metabolites

Bioavailability: 82% (with ritonavir)

Half-life elimination: ~15 hours (with ritonavir)

Time to peak, plasma: 2.5-4 hours

Excretion: Feces (~80%, 41% as unchanged drug); urine (~14%, 8% as unchanged drug)

Related Information

- Antiretroviral Agents

- Common Toxicity Criteria
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause headache
Mental Health: Effects on Psychiatric TreatmentContraindicated with midazolam, pimozide, and triazolam. Nausea is common; combined use with lithium, valproic acid, carbamazepine, and SSRIs may produce an additive risk. May cause neutropenia; use clozapine and carbamazepine with caution. Carbamazepine may decrease the levels of darunavir. St John's wort may decrease the plasma levels of darunavir. Concomitant use of darunavir and St John's wort is not recommended.
Index TermsDarunavir Ethanolate; TMC-114

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(da SA ti nib)

U.S. Brand NamesSprycel®

Canadian Brand NamesSprycel®

Pharmacologic CategoryAntineoplastic Agent, Tyrosine Kinase Inhibitor

Use: Labeled IndicationsTreatment of chronic myelogenous leukemia (CML) in chronic, accelerated or blast (myeloid or lymphoid) phase resistant or intolerant to prior therapy (including imatinib); treatment of Philadelphia chromosome-positive (Ph+) acute lymphoblastic leukemia (ALL) resistant or intolerant to prior therapy

Dosing: Adults

CML:

Chronic phase: Oral: 100 mg once daily. In clinical studies, a dose escalation to 140 mg once daily was allowed in patients not achieving cytogenetic response at recommended initial dosage.

Accelerated or blast phase: Oral: 70 mg twice daily. In clinical studies, a dose escalation to 100 mg twice daily was allowed in patients not achieving cytogenetic response at recommended initial dosage.

Ph+ ALL: Oral: 70 mg twice daily. In clinical studies, a dose escalation to 100 mg twice daily was allowed in patients not achieving cytogenetic response at recommended initial dosage.

Dosage adjustment for concomitant CYP3A4 inhibitors/inducers: Dose reductions are likely to be needed when dasatinib is administered concomitantly with a strong CYP3A4 inhibitor (an alternate medication for CYP3A4 enzyme inhibitors should be investigated first). In the event that dasatinib must be administered concomitantly with a potent enzyme inhibitor, consider reducing dasatinib to 20 mg daily with careful monitoring. (Canadian labeling recommend reducing dose to 20-40 mg daily). If reduced dose is not tolerated, the strong CYP3A4 inhibitor must be discontinued or dasatinib therapy temporarily held until concomitant inhibitor use has ceased. When a strong CYP3A4 inhibitor is discontinued, allow a washout period (~1 week) prior to adjusting dasatinib dose upward.

Concomitant administration with CYP3A4 inducers may require increased dasatinib doses, with careful monitoring; alternatives to the enzyme-inducing agent should be utilized first.

Dosing: ElderlyRefer to adult dosing.

Dosing: Adjustment for Toxicity

Hematologic toxicity:

Chronic phase CML (100 mg daily starting dose): For ANC <0.5 x 10^9/L or platelets <50 x 10^9/L, withhold treatment until ANC ≥1 x 10^9/L and platelets ≥50 x 10^9/L; then resume treatment at the original starting dose if recovery occurs in ≤7 days. If platelets <25 x 10^9/L or recurrence of ANC <0.5 x 10^9/L for >7 days, withhold treatment until ANC ≥1 x 10^9/L and platelets ≥50 x 10^9/L; then resume treatment at 80 mg once daily (2nd episode) or discontinue (3rd episode)

Accelerated or blast phase CML and Ph+ ALL (70 mg twice daily starting dose): For ANC <0.5 x 10^9/L or platelets <10 x 10^9/L, if cytopenia unrelated to leukemia, withhold treatment until ANC ≥1 x 10^9/L and platelets ≥20 x 10^9/L; then resume treatment at the original starting dose. If cytopenia recurs, withhold treatment until ANC ≥1 x 10^9/L and platelets ≥20 x 10^9/L; then resume treatment at 50 mg twice daily (2nd episode) or 40 mg twice daily (3rd episode). For cytopenias related to leukemia (confirm with marrow aspirate or biopsy), consider dose escalation to 100 mg twice daily with careful monitoring.

Nonhematologic toxicity: Withhold treatment until toxicity improvement or resolution; if appropriate, resume treatment at a reduced dose based on the event severity.

Calculations

- ANC: Absolute Neutrophil Count

Administration: OralAdminister once daily (morning or evening) or twice daily (morning and evening). May be taken without regard to food. Do not break, crush, or chew tablets.

Dietary ConsiderationsMay be taken without regard to food. Avoid grapefruit juice.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsThere are no contraindications listed within the FDA-approved manufacturer's labeling.

Canadian labeling: Hypersensitivity to dasatinib or any other component of the formulation

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Severe dose-related bone marrow suppression (thrombocytopenia, neutropenia, anemia) is associated with treatment; dosage adjustment or temporary interruption may be required for severe myelosuppression; the incidence of myelosuppression is higher in patients with advanced CML and Ph+ ALL.

- Fluid retention: Fluid retention, including pleural and pericardial effusions, severe ascites, severe pulmonary edema, and generalized edema were reported; may be dose-related. Use with caution in patients where fluid accumulation may be poorly tolerated, such as in cardiovascular disease (HF or hypertension) and pulmonary disease.

- Hemorrhage: Fatal intracranial hemorrhage has been reported in association with dasatinib use; severe hemorrhage (including CNS, GI) may occur due to thrombocytopenia. In addition to thrombocytopenia, dasatinib may also cause platelet dysfunction.

- QT prolongation: May prolong QT interval; use caution in patients at risk for QT prolongation, including patients with long QT syndrome; patients taking antiarrhythmic medications or other medications that lead to QT prolongation or potassium-wasting diuretics; patients with cumulative high-dose anthracycline therapy, and conditions which cause hypokalemia or hypomagnesemia. Correct hypokalemia and hypomagnesemia prior to initiation of therapy.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment due to extensive hepatic metabolism; patients with ALT or AST >2.5 times the upper limit of normal (ULN) or total bilirubin >2 times the ULN were excluded from clinical trials.

Concurrent drug therapy issues:

- Anticoagulants or antiplatelets: Use with caution in patients taking anticoagulants or medications interfering with platelet function; not studied in clinical trials.

- High potential for interactions: Use with caution in patients receiving concurrent therapy which alters CYP3A4 activity; avoid concomitant use or consider dasatinib dosage adjustments.

Special populations:

- Elderly: Elderly may be more likely to experience fluid retention; monitor closely.

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Geriatric ConsiderationsLimited data available demonstrate no difference in safety or efficacy observed between elderly and younger adults. Elderly may be more sensitive to pharmacologic effects.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated fetal abnormalities (skeletal malformations, reduced ossification, edema, microhepatia) and fetal death. There are no adequate and well-controlled studies in pregnant women. May cause fetal harm if administered to a pregnant woman. Not recommended for use during pregnancy or if contemplating pregnancy. Effective contraception is recommended for men and women of childbearing potential. Pregnant women are advised to avoid contact with crushed or broken tablets.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

≥10%:

- Cardiovascular: Fluid retention (37%; grades 3/4: 8%), superficial edema (20%)

- Central nervous system: Headache (24%), fatigue (21%), fever (13%)

- Dermatologic: Rash (22%; includes erythema, erythema multiforme, erythematous rash, exfoliative rash, follicular rash, heat rash, maculopapular rash, milia, papular rash, pruritic rash, pustular rash, skin exfoliation, skin irritation, systemic lupus erythematosus rash, urticaria vesiculosa, vesicular rash)

- Endocrine & metabolic: Hypophosphatemia (grades 3/4: 6% to 20%), hypocalcemia (grades 3/4: 1% to 16%)

- Gastrointestinal: Diarrhea (31%; grades 3/4: 3%), nausea (22%), vomiting (13%)

- Hematologic: Neutropenia (grades 3/4: 34% to 80%), thrombocytopenia (grades 3/4: 22% to 81%), anemia (grades 3/4: 10% to 75%), hemorrhage (21%; grades 3/4: 6%)

- Neuromuscular & skeletal: Musculoskeletal pain (14%)

- Respiratory: Pleural effusion (22%; grades 3/4: 5%), dyspnea (20%; grades 3/4: 4%)

1% to <10%:

- Cardiovascular: Generalized edema (3%), pericardial effusion (3%; grades 3/4: 1%), CHF/cardiac dysfunction (2%; grades 3/4: 1%; includes cardiac failure, cardiomyopathy, diastolic dysfunction, ejection fraction decreased, left ventricular dysfunction, ventricular failure); arrhythmia, chest pain, flushing, hypertension, palpitation

- Central nervous system: CNS bleeding (1%), chills, depression, dizziness, insomnia, pain, somnolence

Dermatologic: Acne, alopecia, dermatitis, dry skin, eczema, hyperhydrosis, pruritus, urticaria

Gastrointestinal: Abdominal pain (10%), gastrointestinal bleeding (7%; grades 3/4: 4%), abdominal distention, colitis, constipation, dysgeusia, dyspepsia, enterocolitis, gastritis, mucositis/stomatitis, oral soft tissue disorder, weight loss/gain

Hematologic: Contusion, neutropenic fever, pancytopenia

Hepatic: ALT increased (grades 3/4: ≤7%), AST increased (grades 3/4: ≤5%), bilirubin increased (grades 3/4: ≤5%)

Neuromuscular & skeletal: Arthralgia, muscle inflammation, muscle weakness, myalgia, neuropathy, peripheral neuropathy, weakness

Ocular: Visual disorder, xerophthalmia

Renal: Serum creatinine increased (grades 3/4: ≤3%)

Respiratory: Pulmonary edema (2%; grades 3/4: 1%), pulmonary hypertension (1%), cough, lung infiltration, pneumonia, pneumonitis, upper respiratory tract infection/inflammation

Miscellaneous: Infection (bacterial, fungal, viral), herpes virus infection

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acute coronary syndrome, acute febrile neutrophilic dermatosis, acute respiratory distress syndrome, affect lability, amnesia, anal fissure, angina, ascites, asthma, bronchospasm, bullous conditions, cardiomegaly, cerebrovascular accident, cholecystitis, cholestasis, coagulopathy, confusion, conjunctivitis, creatine phosphokinase increased, dysphagia, erythema nodosum, esophagitis, gynecomastia, hand-foot syndrome, hepatitis, hypersensitivity, hyperuricemia, hypoalbuminemia, hypotension, ileus, libido decreased, livedo reticularis, menstrual irregularities, MI, musculoskeletal stiffness, myocarditis, neutropenic colitis, pancreatitis, panniculitis, pericarditis, periorbital edema, photosensitivity, platelet aggregation abnormal, polyuria, proteinuria, pure red cell aplasia, QT_c prolongation, renal failure, reversible posterior leukoencephalopathy syndrome, rhabdomyolysis, seizure, sepsis, skin ulcer, syncope, tendonitis, thrombophlebitis, TIA, tinnitus, tremor, troponin increased, tumor lysis syndrome, upper gastrointestinal ulcer, ventricular arrhythmia, ventricular tachycardia, vertigo

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Anticoagulants: Dasatinib may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: Dasatinib may enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: Dasatinib may increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

H2-Antagonists: May decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Proton Pump Inhibitors: May decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John's wort (may increase metabolism and decrease dasatinib plasma concentration).

Monitoring ParametersCBC with differential (weekly for 2 months, then monthly); bone marrow biopsy; liver function tests, electrolytes including calcium, phosphorus, magnesium; monitor for fluid retention; ECG monitoring if at risk for QT_c prolongation; chest x-ray is recommended for symptoms suggestive of pleural effusion (eg, cough, dyspnea)

Nursing: Physical Assessment/MonitoringMonitor closely any other pharmacological agents or herbal products patient may be taking for effectiveness and possible interactions prior to beginning therapy (eg, anticoagulants, drugs that may affect platelet function, drugs that may prolong QT interval, or CYP3A4 inhibitors); dose adjustments may be necessary. Assess results of laboratory tests on a regular basis (eg, CBC, LFTs, and electrolytes). Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically during therapy (eg, weight and fluid status, gastrointestinal disturbance, hemorrhage, anemia, respiratory or CNS changes). Teach appropriate use, interventions to reduce side effects, and symptoms to report.

Monitoring: Lab TestsCBC with differential (weekly for 2 months, then monthly); liver function tests; electrolytes including calcium, phosphorus, magnesium

Patient EducationDo not take any new prescription or over-the-counter medications, or herbal products during therapy without consulting prescriber. Take exactly as directed; swallow whole; do not break, crush, or chew tablets. May be taken without regard for food; avoid grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be required to have regularly scheduled laboratory tests while on this medication. You will be more susceptible to infection (avoid crowds and exposure to infection and do not receive any vaccination unless approved by prescriber). You may experience headache, dizziness, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug in known); loss of appetite, nausea, vomiting, or mouth sores (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); or diarrhea (buttermilk, boiled milk, or yogurt may reduce diarrhea); loss of hair (will resolve when therapy is discontinued); muscle or joint pain (consult prescriber for analgesic); loss of libido. Report chest pain, palpitations, swelling of extremities, or weight gain >5 lb; cough, respiratory difficulty, or wheezing; skin rash; persistent muscle or bone pain, tremors, or cramping; persistent fatigue or weakness; easy bruising or unusual bleeding (eg, tarry stools, blood in vomitus, stool, urine, or mouth); changes in vision or hearing; persistent GI problems or pain; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant. Consult prescriber for appropriate contraception while using this medication. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, oral:

Sprycel®: 20 mg, 50 mg, 70 mg, 100 mg

Generic AvailableNo

ManufacturerBristol Myers Squibb Co

Mechanism of ActionBCR-ABL tyrosine kinase inhibitor; targets most imatinib-resistant BCR-ABL mutations (except the T315I and F317V mutants) by distinctly binding to ABL-kinase. Kinase inhibition halts proliferation of leukemia cells. Also inhibits SRC family (including SRC, LKC, YES, FYN); c-KIT, EPHA2 and platelet derived growth factor receptor (PDGFRβ)

Pharmacodynamics/Kinetics

Distribution: 2505 L

Protein binding: Dasatinib: 96%; metabolite (active): 93%

Metabolism: Hepatic (extensive); metabolized by CYP3A4 (primarily), flavin-containing mono-oxygenase-3 (FOM-3) and uridine diphosphate-glucuronosyltransferase (UGT) to an active metabolite and other inactive metabolites (the active metabolite plays only a minor role in the pharmacology of dasatinib)

Half-life elimination: Terminal: 3-5 hours

Time to peak, plasma: 0.5-6 hours

Excretion: Feces (85%, 19% as unchanged drug); urine (4%, 0.1% as unchanged drug)

Pharmacotherapy Pearls**Oncology Comment:** In a dose finding study in chronic-phase CML, dasatininb 100 mg once daily provided comparable efficacy to the original FDA-approved dose of 70 mg twice daily. The 100 mg once daily dose was better tolerated (lower rates of pleural effusion and grades 3/4 thrombocytopenia), required fewer dose reductions, and fewer dosing interruptions or discontinuations (Shah, 2008).

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis/stomatitis, taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsDasatinib is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusHeadache, fatigue, and dizziness are common; may cause anxiety, confusion, depression, insomnia, or sedation

Mental Health: Effects on Psychiatric TreatmentSevere hemorrhage may occur due to thrombocytopenia; monitor valproic acid and derivatives closely. GI side effects are common; combined use with lithium, valproic acid, carbamazepine, and SSRIs may produce an additive risk. Hematologic side effects are common; use clozapine and carbamazepine with caution. Nefazodone may increase the levels of dasatinib. Concomitant use of dasatinib and nefazodone is not recommended.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

DAUNOrubicin liposomal may be confused with DACTINomycin, DOXOrubicin, DOXOrubicin liposomal, epirubicin, IDArubicin

Liposomal formulation (DaunoXome®) may be confused with the conventional formulation (Cerubidine®, Rubex®)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(daw noe ROO bi sin SI trate lip po SOE mal)

U.S. Brand NamesDaunoXome®

Pharmacologic CategoryAntineoplastic Agent, Anthracycline

Use: Labeled IndicationsFirst-line treatment of advanced HIV-associated Kaposi's sarcoma (KS)

Dosing: AdultsRefer to individual protocols.

Advanced HIV-associated Kaposi's sarcoma: I.V.: 40 mg/m^2 every 2 weeks

Dosing: ElderlyRefer to adult dosing. Use with caution.

Dosing: Renal Impairment

S_{cr} 1.2-3 mg/dL: Reduce dose to 75% of normal.

S_{cr} >3 mg/dL: Reduce dose to 50% of normal.

Dosing: Hepatic Impairment

Serum bilirubin 1.2-3 mg/dL: Reduce to 75% of normal dose.

Serum bilirubin >3 mg/dL: Reduce to 50% of normal dose.

Dosing: Adjustment for ToxicityWithhold treatment for ANC <750/mm^3

Dosing: Combination Regimens

Leukemia, acute lymphocytic: Hyper-CVAD (Leukemia, Acute Lymphocytic)

Calculations

- Body Surface Area: Adults

Administration: I.V.Infuse over 1 hour; do not mix with other drugs. Avoid extravasation.

Administration: I.V. DetailpH: 5-6

StorageStore intact vials of solution under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Diluted daunorubicin liposomal for infusion may be refrigerated at 2°C to 8°C (36°F to 46°F) for a maximum of 6 hours. Do not use with in-line filters.

ReconstitutionOnly fluid which may be mixed with DaunoXome® is D_5W. Dilute to a 1:1 solution (1 mg daunorubicin liposomal/mL D_5W). Must **not** be mixed with saline, bacteriostatic agents (such as benzyl alcohol), or any other solution.

CompatibilityStable in D_5W. **Incompatible** with normal saline, sodium bicarbonate and fluorouracil, heparin, dexamethasone.

ContraindicationsHypersensitivity to daunorubicin citrate (liposomal), daunorubicin, or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hepatic impairment: See “Disease-related concerns” below.
- Infusion-related reactions: See “Concerns related to adverse effects” below.
- Myocardial toxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: May cause bone marrow suppression,** particularly neutropenia; monitor closely for infections.

- Infusion-related reactions: **[U.S. Boxed Warning]: The lipid component is associated with infusion-related reactions (back pain, flushing, chest tightness) usually within the first 5 minutes of infusion;** monitor, interrupt infusion, and resume at reduced infusion rate.

- Myocardial toxicity: **[U.S. Boxed Warning]: Monitor cardiac function regularly; especially in patients with previous therapy with high cumulative doses of anthracyclines, cyclophosphamide, or thoracic radiation, or who have pre-existing cardiac disease.** Although the risk increases with cumulative dose, irreversible cardiotoxicity may occur with anthracycline treatment at any dose level. Patients with pre-existing heart disease, hypertension, concurrent administration of other antineoplastic agents, prior or concurrent chest irradiation, and advanced age are at increased risk. Evaluate left ventricular ejection fraction (LVEF) prior to treatment and periodically during treatment.

Disease-related concerns:

- Hepatic impairment: **[U.S. Boxed Warning]: Use with caution in patients with hepatic impairment;** dosage reduction is recommended.

- Renal impairment: Use with caution in patients with renal impairment; may require dosage reduction.

Special populations:

- Elderly: Use with caution in the elderly; safety and efficacy have not been established.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects and embryotoxicity were noted in animal studies. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant while receiving treatment.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Cardiovascular: Edema (11%)

Central nervous system: Fatigue (49%), fever (47%), headache (25%), neutropenic fever (17%)

Gastrointestinal: Nausea (54%), diarrhea (38%), abdominal pain (23%), anorexia (23%), vomiting (23%)

Hematologic: Myelosuppression (onset: 7 days; nadir: 14 days; recovery 21 days), neutropenia (up to 55%; grade 4: 15%), anemia (up to 55%; grade 4: 2%), thrombocytopenia (up to 12%; grade 4: 1%)

Neuromuscular & skeletal: Rigors (19%), back pain (16%), neuropathy (13%)

Respiratory: Cough (28%), dyspnea (26%), rhinitis (12%)

Miscellaneous: Opportunistic infections (40%), allergic reactions (24%), diaphoresis (14%), infusion-related reactions (14%; includes back pain, flushing, chest tightness)

1% to 10%:

Cardiovascular: Chest pain (10%), hypertension (≤5%), palpitation (≤5%), syncope (≤5%), tachycardia (≤5%), LVEF decreased (3%), CHF/cardiomyopathy

Central nervous system: Depression (10%), malaise (10%), dizziness (8%), insomnia (6%), abnormal thinking (≤5%), amnesia (≤5%), anxiety (≤5%), ataxia (≤5%), confusion (≤5%), emotional lability (≤5%), hallucination (≤5%), meningitis (≤5%), seizure (≤5%), somnolence (≤5%)

Dermatologic: Alopecia (8%), pruritus (7%), dry skin (≤5%), folliculitis (≤5%), seborrhea (≤5%)

Endocrine & metabolic: Dehydration (≤5%), hot flashes (≤5%)

Gastrointestinal: Stomatitis (10%), constipation (7%), tenesmus (5%), appetite increased (≤5%), dental caries (≤5%), dysphagia (≤5%), gastrointestinal hemorrhage (≤5%), gastritis (≤5%), gingival bleeding (≤5%), hemorrhoids (≤5%), melena (≤5%), splenomegaly (≤5%), taste perversion (≤5%), xerostomia (≤5%)

Genitourinary: Dysuria (≤5%), nocturia (≤5%), polyuria (≤5%)

Hepatic: Hepatomegaly (≤5%)

Local: Injection site inflammation (≤5%)

Neuromuscular & skeletal: Arthralgia (7%), myalgia (7%), gait abnormal (≤5%), hyperkinesia (≤5%), hypertonia (≤5%), tremor (≤5%)

Ocular: Abnormal vision (5%) conjunctivitis (≤5%), eye pain (≤5%)

Otic: Deafness (≤5%), earache (≤5%), tinnitus (≤5%)

Respiratory: Sinusitis (8%), hemoptysis (≤5%), pulmonary infiltrate (≤5%), sputum increased (≤5%)

Miscellaneous: Flu-like syndrome (5%), hiccups (≤5%), lymphadenopathy (≤5%), thirst (≤5%)

Postmarketing and/or case reports: Angina, atrial fibrillation, cardiac arrest, MI, pericardial effusion, pericardial tamponade, pulmonary hypertension, supraventricular tachycardia, ventricular extrasystoles

Oncology: VesicantNo; may be an irritant
Oncology: Emetic PotentialModerate (30% to 60%)
Drug Interactions

Bevacizumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk C: Monitor therapy*

Cardiac Glycosides: May diminish the cardiotoxic effect of Antineoplastic Agents (Anthracycline). Antineoplastic Agents (Anthracycline) may decrease the serum concentration of Cardiac Glycosides. The effects of liposomal formulations may be unique from those of the free drug, as liposomal formulation have unique drug disposition and toxicity profiles, and liposomes themselves may alter digoxin absorption/distribution. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Taxane Derivatives: May enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersCBC with differential and platelets (prior to each dose), liver function tests, renal function tests; evaluate cardiac function (baseline left ventricular ejection fraction [LVEF] prior to treatment initiation; repeat LVEF at total cumulative doses of 320 mg/m^2, and every 160 mg/m^2 thereafter; patients with pre-existing cardiac disease, history of prior chest irradiation, or history of prior anthracycline treatment should have baseline LVEF and every 160 mg/m^2 thereafter); signs and symptoms of infection or disease progression; monitor closely for infusion reactions

Nursing: Physical Assessment/MonitoringShould only be administered under the supervision of an experienced cancer chemotherapy physician. Evaluate patient for use cautions prior to beginning therapy (eg, pre-existing bone marrow depressions, impaired hepatic or renal function, or cardiac disease). Infusion site should be closely monitored to avoid extravasation. Patient must be monitored closely during infusions for infusion-related reaction (back pain, flushing, chest tightness). If infusion reaction occurs, interrupt infusion and restart at reduced rate. Evaluate results of laboratory tests, therapeutic response, and adverse reactions prior to each treatment and throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelets (prior to each dose), liver function tests, renal function tests; evaluate cardiac function (baseline left ventricular ejection fraction [LVEF] prior to treatment initiation; repeat LVEF at total cumulative doses of 320 mg/m^2, and every 160 mg/m^2 thereafter; patients with pre-existing cardiac disease, history of prior chest irradiation, or history of prior anthracycline treatment should have baseline LVEF and every 160 mg/m^2 thereafter)

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. This medication can only be administered by infusion. You will be monitored closely. Report immediately any swelling, pain, burning, or redness at infusion site; chest pain or tightness; or difficulty breathing or swallowing. It is important that you maintain adequate nutrition between treatments (small, frequent meals may help) and adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); loss of hair (reversible); or red-pink urine (normal). Report immediately chest pain, palpitations, rapid heartbeat, swelling of extremities, or difficulty breathing. Report unresolved nausea, vomiting, or diarrhea; alterations in urinary pattern (increased or decreased); opportunistic infection (eg, fever, chills, unusual bruising or bleeding, fatigue, purulent vaginal discharge, unhealed mouth sores); CNS changes (depression, insomnia, abnormal thinking, confusion, seizures); abdominal pain or blood in stools; excessive fatigue; or yellowing of eyes or skin. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

DaunoXome®: 2 mg/mL (25 mL) [contains sucrose 2125 mg/25 mL]

Generic AvailableNo

Mechanism of ActionLiposomes have been shown to penetrate solid tumors more effectively, possibly because of their small size and longer circulation time. Once in tissues, daunorubicin is released. Daunorubicin inhibits DNA and RNA synthesis by intercalation between DNA base pairs and by steric obstruction; and intercalates at points of local uncoiling of the double helix. Although the exact mechanism is unclear, it appears that direct binding to DNA (intercalation) and inhibition of DNA repair (topoisomerase II inhibition) result in blockade of DNA and RNA synthesis and fragmentation of DNA.

Pharmacodynamics/Kinetics

Distribution: V_d: 5-8 L

Metabolism: Similar to daunorubicin, but metabolite plasma levels are low

Half-life elimination: Distribution: 4.4 hours; Terminal: 3-5 hours

Excretion: Primarily feces; some urine

Clearance, plasma: 17.3 mL/minute

Related Information

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

DAUNOrubicin may be confused with DACTINomycin, DOXOrubicin, DOXOrubicin liposomal, epirubicin, IDArubicin

Conventional formulation (Cerubidine®, DAUNOrubicin hydrochloride) may be confused with the liposomal formulation (DaunoXome®)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(daw noe ROO bi sin hye droe KLOR ide)

U.S. Brand NamesCerubidine®

Canadian Brand NamesCerubidine®

Pharmacologic CategoryAntineoplastic Agent, Anthracycline

Use: Labeled IndicationsTreatment of acute lymphocytic (ALL) and nonlymphocytic (ANLL) leukemias

Dosing: AdultsRefer to individual protocols. **Note:** Cumulative dose should not exceed 550 mg/m^2 in adults without risk factors for cardiotoxicity and should not exceed 400 mg/m^2 in adults receiving chest irradiation.

Range: I.V.: 30-60 mg/m^2/day for 3 days, repeat dose in 3-4 weeks

ALL combination therapy: I.V.: 45 mg/m^2/day for 3 days

AML combination therapy (induction): I.V.: Adults <60 years: Induction: 45 mg/m^2/day for 3 days of the first course of induction therapy; subsequent courses: 45 mg/m^2/day for 2 days

Dosing: Elderly

ALL combination therapy: I.V.: 45 mg/m^2/day for 3 days

AML combination therapy (induction): Elderly ≥60 years: Induction: 30 mg/m^2/day for 3 days of the first course of induction therapy; subsequent courses: 30 mg/m^2/day for 2 days

Dosing: PediatricRefer to individual protocols. **Note:** Cumulative dose should not exceed 300 mg/m^2 in children >2 years or 10 mg/kg in children <2 years of age; maximum cumulative doses for younger children are unknown.

ALL combination therapy: I.V.:

Children <2 years or BSA <0.5 m^2: 1 mg/kg/dose per protocol, with frequency dependent on regimen employed

Children ≥2 years and BSA ≥0.5 m^2: Remission induction: 25 mg/m^2 on day 1 every week for up to 4-6 cycles

AML combination therapy (induction): Children ≥2 years and BSA ≥0.5 m^2: I.V. continuous infusion: 30-60 mg/m^2/day on days 1-3 of cycle

Dosing: Renal Impairment

The FDA-approved labeling recommends the following adjustment: S_{cr} >3 mg/dL: Administer 50% of normal dose.

The following guidelines have been used by some clinicians (Aronoff, 2007):

Children:

Cl_{cr} <30 mL/minute: Administer 50% of dose.

Hemodialysis/continuous ambulatory peritoneal dialysis (CAPD): Administer 50% of dose.

Adults: No adjustment recommended.

Dosing: Hepatic Impairment

The FDA-approved labeling recommends the following adjustments:

Serum bilirubin 1.2-3 mg/dL: Administer 75% of dose.

Serum bilirubin >3 mg/dL: Administer 50% of dose.

The following guidelines have been used by some clinicians (Floyd, 2006):

Serum bilirubin 1.2-3 mg/dL: Administer 75% of dose

Serum bilirubin 3.1-5 mg/dL: Administer 50% of dose

Serum bilirubin >5 mg/dL: Avoid use

Dosing: Combination Regimens

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Vesicant. **Never** administer I.M. or SubQ. Administer as slow I.V. push over 1-5 minutes into the tubing of a rapidly infusing I.V. solution of D_5W or NS or dilute in 100 mL of D_5W or NS and infuse over 15-30 minutes.

Administration: I.V. DetailAvoid extravasation, can cause severe tissue damage. Flush with 5-10 mL of I.V. solution before and after drug administration.

pH: 4.5-6.5

StorageStore intact vials of powder for injection at room temperature of 15°C to 30°C (59°F to 86°F); intact vials of solution for injection should be refrigerated at 2°C to 8°C (36°F to 46°F). Protect from light. Reconstituted solution is stable for 4 days at 15°C to 25°C. Further dilution in D_5W, LR, or NS is stable at room temperature (25°C) for up to 4 weeks if protected from light.

ReconstitutionDilute vials of powder for injection with 4 mL SWFI for a final concentration of 5 mg/mL. May further dilute in 100 mL D_5W or NS.

CompatibilityStable in D_5W, LR, NS, sterile water for injection. **Incompatible** with heparin, sodium bicarbonate, fluorouracil, and dexamethasone.

Y-site administration: Compatible: Amifostine, etoposide phosphate, filgrastim, gemcitabine, granisetron, melphalan, methotrexate, ondansetron, sodium bicarbonate, teniposide, thiotepa, vinorelbine. **Incompatible:** Allopurinol, aztreonam, cefepime, fludarabine, piperacillin/tazobactam.

Compatibility when admixed: Compatible: Cytarabine with etoposide, hydrocortisone sodium succinate. **Incompatible:** Dexamethasone sodium phosphate, heparin.

ContraindicationsHypersensitivity to daunorubicin or any component of the formulation

Allergy Considerations

- Anthracycline Allergy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.

- Hepatic impairment: See “Disease-related concerns” below.

- Myocardial toxicity: See “Concerns related to adverse effects” below.

- Renal impairment: See “Disease-related concerns” below.

- Skin irritation/extravasation: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: May cause severe bone marrow suppression.**

- Myocardial toxicity: **[U.S. Boxed Warning]: May cause cumulative, dose-related myocardial toxicity (concurrent or delayed).** Total cumulative dose should take into account previous or concomitant treatment with cardiotoxic agents or irradiation of chest. The incidence of irreversible myocardial toxicity increases as the total cumulative (lifetime) dosages approach: 550 mg/m^2 in adults; 400 mg/m^2 in adults receiving chest radiation; 300 mg/m^2 in children >2 years of age, or 10 mg/kg in children <2 years of age. Although the risk increases with cumulative dose, irreversible cardiotoxicity may occur at any dose level. Patients with pre-existing heart disease, hypertension, concurrent administration of other antineoplastic agents, prior or concurrent chest irradiation, advanced age; and infants and children are at increased risk. Monitor left ventricular (LV) function (baseline and periodic) with ECHO or MUGA scan; monitor ECG.

- Secondary malignancy: Secondary leukemias may occur when used with combination chemotherapy or radiation therapy.

- Skin irritation/extravasation: **[U.S. Boxed Warning]: For I.V. administration only. Potent vesicant; if extravasation occurs, severe local tissue damage leading to ulceration and necrosis, and pain may occur.**

Disease-related concerns:

- Hepatic impairment: **[U.S. Boxed Warning]: Use with caution in patients with hepatic impairment;** dosage adjustment recommended.

- Renal impairment: **[U.S. Boxed Warning]: Use with caution in patients with renal impairment;** dosage adjustment recommended.

Special populations:

- Radiation recipients: Use with caution in patients who have received radiation therapy; reduce dosage in patients who are receiving radiation therapy simultaneously.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD
Pregnancy ConsiderationsMay cause fetal harm when administered to a pregnant woman. Animal studies have shown an increased incidence of fetal abnormalities.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Cardiovascular: Transient ECG abnormalities (supraventricular tachycardia, S-T wave changes, atrial or ventricular extrasystoles); generally asymptomatic and self-limiting. CHF, dose related, may be delayed for 7-8 years after treatment.

Dermatologic: Alopecia (reversible), radiation recall

Gastrointestinal: Mild nausea or vomiting, stomatitis

Genitourinary: Discoloration of urine (red)

Hematologic: Myelosuppression (onset: 7 days; nadir: 10-14 days; recovery: 21-28 days), primarily leukopenia; thrombocytopenia and anemia

1% to 10%:

Dermatologic: Skin “flare” at injection site; discoloration of saliva, sweat, or tears

Endocrine & metabolic: Hyperuricemia

Gastrointestinal: Abdominal pain, GI ulceration, diarrhea

<1%: Anaphylactoid reaction, bilirubin increased, hepatitis, infertility; local (cellulitis, pain, thrombophlebitis at injection site); MI, myocarditis, nail banding, onycholysis, pericarditis, pigmentation of nailbeds, secondary leukemia, skin rash, sterility, systemic hypersensitivity (including urticaria, pruritus, angioedema, dysphagia, dyspnea); transaminases increased

Oncology: VesicantYes; see Management of Drug Extravasations.
Oncology: Emetic PotentialModerate (30% to 60%)
Drug Interactions

Bevacizumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk C: Monitor therapy*

Cardiac Glycosides: May diminish the cardiotoxic effect of Antineoplastic Agents (Anthracycline). Antineoplastic Agents (Anthracycline) may decrease the serum concentration of Cardiac Glycosides. The effects of liposomal formulations may be unique from those of the free drug, as liposomal formulation have unique drug disposition and toxicity profiles, and liposomes themselves may alter digoxin absorption/distribution. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Taxane Derivatives: May enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).

Monitoring ParametersCBC with differential and platelet count, liver function test, ECG, left ventricular ejection function (echocardiography [ECHO] or multigated radionuclide angiography [MUGA] scan), renal function test

Nursing: Physical Assessment/MonitoringUse with caution in presence of pre-existing bone marrow suppression, impaired hepatic or renal function, or cardiac disease. Infusion site must be closely monitored; extravasation can cause severe cellulitis or tissue necrosis. Assess results of laboratory tests (prior to therapy and periodically during treatment), therapeutic response, and adverse effects (tachycardia, cough, dyspnea, gastrointestinal upset) prior to each infusion and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count, liver function test, ECG, left ventricular ejection function (echocardiography [ECHO] or multigated radionuclide angiography [MUGA] scan), renal function test

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. This medication can only be administered I.V. Report immediately any swelling, pain, burning, or redness at infusion site. Avoid alcohol. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); loss of hair (reversible); or red-pink urine (normal). Report immediately chest pain, swelling of extremities, respiratory difficulty, palpitations, or rapid heartbeat. Report unresolved nausea, vomiting, or diarrhea; alterations in urinary pattern (increased or decreased); opportunistic infection (eg, fever, chills, unusual bruising or bleeding fatigue, purulent vaginal discharge, unhealed mouth sores); abdominal pain or blood in stools; excessive fatigue; or yellowing of eyes or skin. **Pregnancy/breast-feeding precautions:** Do not get pregnant or cause a pregnancy (males) while taking this medication. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. **Note: Strength expressed as base**

Injection, powder for reconstitution: 20 mg

Cerubidine®: 20 mg [contains mannitol 100 mg]

Injection, solution: 5 mg/mL (4 mL, 10 mL)

Generic AvailableYes

Mechanism of ActionInhibition of DNA and RNA synthesis by intercalation between DNA base pairs and by steric obstruction. Daunomycin intercalates at points of local uncoiling of the double helix. Although the exact mechanism is unclear, it appears that direct binding to DNA (intercalation) and inhibition of DNA repair (topoisomerase II inhibition) result in blockade of DNA and RNA synthesis and fragmentation of DNA.

Pharmacodynamics/Kinetics

Distribution: Many body tissues, particularly the liver, kidneys, lung, spleen, and heart; not into CNS; crosses placenta; V_d: 40 L/kg

Metabolism: Primarily hepatic to daunorubicinol (active), then to inactive aglycones, conjugated sulfates, and glucuronides

Half-life elimination: Distribution: 2 minutes; Elimination: 14-20 hours; Terminal: 18.5 hours; Daunorubicinol plasma half-life: 24-48 hours

Excretion: Feces (40%); urine (~25% as unchanged drug and metabolites)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(de SYE ta been)
U.S. Brand NamesDacogen™
Pharmacologic CategoryAntineoplastic Agent, DNA Methylation Inhibitor
Use: Labeled IndicationsTreatment of myelodysplastic syndrome (MDS)
Use: Unlabeled/InvestigationalTreatment of acute myelogenous leukemia (AML), chronic myelogenous leukemia (CML), sickle cell anemia
Dosing: Adults

MDS: I.V.: 15 mg/m^2 over 3 hours every 8 hours (45 mg/m^2/day) for 3 days (135 mg/m^2 /cycle) every 6 weeks (treatment is recommended for at least 4 cycles and may continue until the patient no longer continues to benefit) **or**

Low-dose schedule (unlabeled): 20 mg/m^2 over 1 hour daily for 5 days every 28 days

AML (investigational use): I.V.:

5-15 mg/m^2 over 1 hour daily, 5 days/week for 2 weeks (5 days on, 2 days off, 5 days on; 10 doses total) every 6 weeks

or

15 mg/m^2 over 1 hour daily for 10 days every 6 weeks

CML (investigational use): I.V.:

20 mg/m^{2}over 1 hour daily for 5 days every 28 days

or

10-15 mg/m^2 over 1 hour daily, 5 days/week for 2 weeks (5 days on, 2 days off, 5 days on; 10 doses total) every 6 weeks

or

50-75 mg/m^2 over 6 hours every 12 hours for 5 days every 4-8 weeks

Sickle cell anemia (investigational use): I.V., SubQ: 0.15-0.3 mg/kg/day over 2 minutes 5 days/week for 2 weeks (5 days on, 2 days off, 5 days on; 10 doses total) every 6 weeks

Dosing: ElderlyRefer to adult dosing.
Dosing: Adjustment for Toxicity

For delayed hematologic recovery (ANC ≥1000/mm^3 and platelets ≥50,000/mm^3):

Greater than 6 weeks but less than 8 weeks: Delay dose for up to 2 weeks and temporarily reduce dose to 11 mg/m^2 every 8 hours (33 mg/m^2/day) for 3 days

Greater than 8 weeks but less than 10 weeks: Assess for disease progression; if no disease progression, delay dose for up to 2 weeks and reduce dose to 11 mg/m^2 every 8 hours (33 mg/m^2/day) for 3 days; maintain or increase dose with subsequent cycles if clinically indicated

Temporarily hold treatment until resolution for any of the following nonhematologic toxicities:

Serum creatinine ≥2 mg/dL

ALT, bilirubin ≥2 times ULN

Active or uncontrolled infection

Dosing: Combination Regimens

Leukemia, chronic myelogenous: Decitabine (Low Dose Regimen)

Myelodysplastic syndrome: Decitabine (Low Dose Regimen)

Calculations

- ANC: Absolute Neutrophil Count
- Body Surface Area: Adults

Administration: I.V.Infuse over 1-6 hours. Premedication with antiemetics is recommended.
Administration: I.V. DetailpH: 6.7-7.3
StorageStore vials at 15°C to 30°C (59°F to 86°F). Solutions diluted for infusion may be stored for up to 7 hours under refrigeration at 2°C to 8°C (36°F to 46°F) if prepared with cold infusion fluids.
ReconstitutionVials should be reconstituted with 10 mL SWFI to a concentration of 5 mg/mL. Further dilute with 50-250 mL NS, D_5W, or lactated Ringer's to a final concentration of 0.1-1 mg/mL. Solutions not administered within 15 minutes of preparation should be prepared with cold (2°C to 8°C [36°F to 46°F]) infusion solutions.
CompatibilityStable in NS, D_5W, and lactated Ringer's.
ContraindicationsHypersensitivity to decitabine or any component of the formulation
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: The dose-limiting toxicity is bone marrow suppression; worsening neutropenia is common in first two treatment cycles and may not correlate with progression of underlying MDS; may require growth factor support.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; use not studied in this population.

- Renal impairment: Use with caution in patients with renal impairment; use not studied in this population.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD
Pregnancy ConsiderationsTeratogenic effects, decreased fetal weight, and increased fetal deaths were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy during treatment. In addition, males should be advised to avoid fathering a child while on decitabine therapy and for 2 months after treatment.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (25%), pallor (23%), edema (18%), cardiac murmur (16%)

Central nervous system: Pyrexia (6% to 53%), headache (28%), insomnia (28%), dizziness (18%), pain (13%), confusion (12%), lethargy (12%), anxiety (11%), hypoesthesia (11%)

Dermatologic: Petechiae (39%), bruising (22%), rash (19%), erythema (14%), cellulitis (12%), lesions (11%), pruritus (11%)

Endocrine & metabolic: Hyperglycemia (33%), hypoalbuminemia (7% to 24%), hypomagnesemia (24%), hypokalemia (22%), hyperkalemia (13%), hyponatremia (13%)

Gastrointestinal: Nausea (42%), constipation (35%), diarrhea (34%), vomiting (25%), anorexia (16%), appetite decreased (16%), abdominal pain (5% to 14%), oral mucosal petechiae (13%), stomatitis (12%), dyspepsia (12%)

Hematologic: Neutropenia (90%; recovery 28-50 days), thrombocytopenia (89%), anemia (82%), febrile neutropenia (29%), leukopenia (28%), lymphadenopathy (12%)

Hepatic: Hyperbilirubinemia (14%), alkaline phosphatase increased (11%)

Local: Tenderness (11%)

Neuromuscular & skeletal: Rigors (22%), arthralgia (20%), limb pain (19%), back pain (17%)

Respiratory: Cough (40%), pneumonia (22%), pharyngitis (16%), lung crackles (14%)

5% to 10%:

Cardiovascular: Chest discomfort (7%), facial swelling (6%), hypotension (6%)

Central nervous system: Malaise (5%)

Dermatologic: Alopecia (8%), urticaria (6%)

Endocrine & metabolic: Hyperuricemia (10%), LDH increased (8%), bicarbonate increased (6%), dehydration (6%), hypochloremia (6%), bicarbonate decreased (5%), hypoproteinemia (5%)

Gastrointestinal: Gingival bleeding (8%), hemorrhoids (8%), loose stools (7%), tongue ulceration (7%), dysphagia (6%), oral candidiasis (6%), lip ulceration (5%), abdominal distension (5%), gastroesophageal reflux (5%), glossodynia (5%)

Genitourinary: Urinary tract infection (7%), dysuria (6%), polyuria (5%)

Hematologic: Hematoma (5%), thrombocythemia (5%), bacteremia (5%)

Hepatic: Ascites (10%), AST increased (10%), hypobilirubinemia (5%)

Local: Catheter infection (8%), catheter site erythema (5%), catheter site pain (5%), injection site swelling (5%)

Neuromuscular & skeletal: Falling (8%), chest wall pain (7%), musculoskeletal discomfort (6%), crepitation (5%), myalgia (5%)

Ocular: Blurred vision (6%)

Respiratory: Breath sounds diminished (10%), hypoxia (10%), rales (8%), pulmonary edema (6%), postnasal drip (5%), sinusitis (5%)

Miscellaneous: Candidal infection (10%), staphylococcal infection (7%), transfusion reaction (7%)

<5%, postmarketing, and/or case reports: Anaphylactic reaction, atrial fibrillation, bronchopulmonary aspergillosis, cardiomyopathy, cardiorespiratory failure, catheter site hemorrhage, chest pain, CHF, cholecystitis, dyspnea, fungal infection, gastrointestinal hemorrhage, gingival pain, hemoptysis, hypersensitivity, intracranial hemorrhage, mental status change, MI, mucosal inflammation, mycobacterium avium complex infection, peridiverticular abscess, pseudomonal lung infection, pulmonary embolism, pulmonary infiltrates, pulmonary mass, renal failure, respiratory arrest, respiratory tract infection, sepsis, splenomegaly, supraventricular tachycardia, urethral hemorrhage, weakness

Oncology: Emetic PotentialLow (10% to 30%)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersCBC and platelets with each cycle, more frequently if needed; liver enzymes; serum creatinine

Nursing: Physical Assessment/MonitoringPremedication with antiemetic is recommended. Assess results of laboratory tests (CBC with platelets, liver enzymes, serum creatinine) at baseline and with each cycle (more frequently if needed). Assess therapeutic response and adverse reactions (eg, neutropenia, thrombocytopenia, anemia, pulmonary edema, gastrointestinal disturbance, CNS changes, hyperglycemia) prior to each cycle and periodically as indicated during therapy. Advise patients with diabetes to monitor serum glucose closely (may cause hyperglycemia). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC and platelets with each cycle, more frequently if needed; liver enzymes; serum creatinine

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by intravenous infusion. Report immediately any redness, swelling, pain, or burning at infusion site, or any adverse response during infusion (eg, respiratory difficulty, facial edema, pain, restlessness, tremor, wheezing). Maintain adequate hydration (2-3 L/day of fluid) unless instructed to restrict fluid intake and nutrition (small frequent meals). You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). If you have diabetes, you should monitor serum glucose closely; may cause hyperglycemia. May cause lethargy, dizziness, visual changes, confusion, anxiety (avoid driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or dry mouth (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help if unresolved, consult prescriber for antiemetic); mouth sores (use soft toothbrush or cotton swabs for mouth care); loss of hair (may grow back when treatment is discontinued); diarrhea or constipation (consult prescriber if persistent). Report respiratory difficulty; chest pain or palpitations; unusual bleeding, bruising or rash; any sign of urinary tract infection (itching or burning) or opportunistic infection (eg, sore throat, fever, chills, fatigue, thrush, vaginal discharge, diarrhea) or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Males should not cause a pregnancy while on therapy and for 2 months after treatment. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Dacogen™: 50 mg

Generic AvailableNo

ManufacturerMGI Pharma

Mechanism of ActionAfter phosphorylation, decitabine is incorporated into DNA and inhibits DNA methyltransferase causing hypomethylation and subsequent cell death.

Pharmacodynamics/Kinetics

Distribution: 63-89 L/m^2

Protein binding: <1%

Metabolism: Extrahepatic; possibly via deamination by cytidine deaminase

Half-life elimination: ~30-35 minutes

Time to peak: At end of infusion

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral mucosal petechiae, stomatitis, gingival bleeding, tongue ulceration, oral candidiasis, lip ulceration, mucosal inflammation, gingival pain have been reported.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia, dizziness, confusion, lethargy, and anxiety are common

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; combined use with lithium, valproic acid, carbamazepine, and SSRIs may produce an additive risk. Neutropenia and thrombocytopenia are common; concomitant use with clozapine, carbamazepine, and valproic acid may produce additive risks.

Index Terms5-Aza-2'-deoxycytidine; 5-AzaC; NSC-127716

Special Alerts

Deferasirox: Postmarketing Reports of Hepatic Failure - December 2007; Health Canada Update - March 2008

Novartis, in conjunction with the U.S. Food and Drug Administration (FDA) and Health Canada have issued respective “Dear Healthcare Professional” letters regarding updates to the warnings, adverse reactions, and dosage and administration sections in the labeling of deferasirox (Exjade®). Labeling changes include clarification and more detailed information concerning serious hepatic reactions (dysfunction/failure) and a recommendation to withhold therapy for severe or persistent hepatic function test abnormalities. The updates were prompted by postmarketing reports of hepatic failure (including fatalities) in association with deferasirox therapy. Most of the reported events occurred in patients >55 years of age with underlying comorbidities, including hepatic cirrhosis and multiorgan failure. The decision to initiate deferasirox therapy to reduce iron overload should be individualized based on the expected benefits/risks of therapy.

Additional information may be found at:

http://www.fda.gov/medwatch/safety/2007/safety07.htm#Exjade

http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/2008/exjade_2_hpc-cps_e.html

Medication Safety Issues

Sound-alike/look-alike issues:

Deferasirox may be confused with deferoxamine

Pronunciation(de FER a sir ox)

U.S. Brand NamesExjade®

Canadian Brand NamesExjade®

Pharmacologic CategoryAntidote; Chelating Agent

Use: Labeled IndicationsTreatment of chronic iron overload due to blood transfusions (transfusional hemosiderosis)

Dosing: Adults**Chronic iron overload due to blood transfusion:** Oral:

Initial: 20 mg/kg daily (calculate dose to nearest whole tablet)

Maintenance: Adjust dose every 3-6 months based on serum ferritin levels; increase by 5-10 mg/kg/day (calculate dose to nearest whole tablet); titrate. Maximum dose: 30 mg/kg/day; consider interrupting therapy for serum ferritin <500 mcg/L. In clinical trials, doses were individualized based on iron burden determined by liver iron concentrations (LIC); transfusional iron intake should be considered when individualizing maintenance dose. **Note:** Consider dose reduction or interruption for hearing loss or visual disturbances.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥2 years: Refer to adult dosing.

Dosing: Renal ImpairmentInterrupt treatment for progressive increase in serum creatinine above the age-appropriate ULN; once serum creatinine recovers to within the normal range, reinitiate treatment at a reduced dose; gradually escalate the dose if the clinical benefit outweighs potential risk.

Children: For increase in serum creatinine >33% on 2 consecutive measures and above the age-appropriate ULN for 2 consecutive levels, reduce daily dose by 10 mg/kg

Adults: For increase in serum creatinine >33% above the average pretreatment level at 2 consecutive levels (and cannot be attributed to other causes), reduce daily dose by 10 mg/kg

Dosing: Hepatic ImpairmentConsider dose adjustment or discontinuation for severe or persistent elevations in liver function tests.

Dosing: Adjustment for ToxicityConsider dose reduction or interruption for hearing loss or visual disturbances.

Administration: Oral**Do not chew or swallow whole tablets.** Take at same time each day on an empty stomach, 30 minutes before food. Disperse tablets in water, orange juice, or apple juice (use 3.5 ounces for total doses <1 g; 7 ounces for doses ≥1 g); stir to form suspension and drink entire contents. Rinse remaining residue with more fluid; drink. Do not take simultaneously with aluminum-containing antacids.

Dietary ConsiderationsBioavailability increased variably when taken with food; take on empty stomach 30 minutes before a meal.

StorageStore at room temperature of 25°C (77°F); excursions between 15°C and 30°C (59°F and 86°F) permitted. Protect from moisture.

ContraindicationsHypersensitivity to deferasirox or any component of the formulation

Canadian labeling: Additional contraindications (not in U.S. labeling): Cl_{cr} <60 mL/minute

Allergy Considerations

- Deferasirox Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Auditory disturbances: Decreased hearing and high frequency hearing loss have been reported with use; monitor and consider dose reduction or treatment interruption.

- Cytopenias: Cytopenias (including agranulocytosis, neutropenia, and thrombocytopenia) have been reported, predominately in patients with preexisting hematologic disorders; monitor closely. Interrupt treatment for unexplained cytopenias.

- Gastrointestinal effects: Gastrointestinal (GI) irritation, as well as upper GI ulceration and hemorrhage have been reported. Use caution with concurrent medications that may increase risk of adverse GI effects (eg, NSAIDs, corticosteroids, anticoagulants). Monitor patients closely for signs/symptoms of GI ulceration/bleeding.

- Hepatotoxicity: Severe hepatic dysfunction or failure (including fatalities) have occurred (postmarketing reports), mostly in patients >55 years of age with underlying comorbidities (including hepatic cirrhosis and multiorgan failure). Hepatitis and elevated transaminases have also been reported; monitor transaminases and consider dose modification or interruption of therapy with severe or persistent hepatic function test abnormalities. Has not been studied in patients with hepatic impairment, although has been used in patients with baseline transaminases ≤5 times ULN (deferasirox pharmacokinetics were not altered with these transaminase levels). Use with caution.

- Hypersensitivity: Hypersensitivity reactions, including severe reactions (anaphylaxis and angioedema) have been reported, usually within the first month of treatment. Discontinuation of therapy may be necessary.

- Nephrotoxicity: Cases of acute renal failure (some fatal) and dose-related elevations in serum creatinine have been reported. Monitor serum creatinine in patients at risk for renal complications (eg, pre-existing renal conditions, elderly, comorbid conditions, and/or with concurrent medications that may affect renal function); consider dose reduction, interruption, or discontinuation for serum creatinine elevations. Has not been studied in patients with renal impairment; patients with baseline serum creatinine above the upper limit of normal (ULN) were excluded from clinical trials. May cause proteinuria; monitor closely.

- Ocular disturbances: Lens opacities, cataracts, intraocular pressure elevation, and retinal disorders have been reported with use; monitor and consider dose reduction or treatment interruption.

- Rash: May cause skin rash (dose-related); mild-to-moderate rashes may resolve without treatment interruption; for severe rash, interrupt and consider restarting at a lower dose with dose escalation and oral steroids.

Concurrent drug therapy issues:

- Other iron chelation drugs: Do not combine with other iron chelation therapies; safety of combinations has not been established.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Geriatric ConsiderationsStudies to date have not included sufficient numbers of subjects ≥65 years of age. Use caution in patients with liver dysfunction or low serum albumin. Monitor renal function. In general, this drug should be used with caution and close monitoring in elderly due to the greater incidence of decreased hepatic, renal, cardiac function, as well as concomitant disease and drug therapy.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Fever (19%), headache (16%)

Dermatologic: Rash (8% to 11%)

Gastrointestinal: Abdominal pain (21% to 28%), diarrhea (12% to 20%), nausea (11% to 23%), vomiting (10% to 21%)

Renal: Serum creatinine increased (dose related; 7% to 38%), proteinuria (19%)

Respiratory: Cough (14%), nasopharyngitis (13%), pharyngolaryngeal pain (11%)

Miscellaneous: Influenza (11%)

1% to 10%:

Central nervous system: Fatigue (6%)

Dermatologic: Urticaria (4%)

Hepatic: ALT increased (2% to 8%), transaminitis (4%)

Neuromuscular & skeletal: Arthralgia (7%), back pain (6%)

Otic: Ear infection (5%)

Respiratory: Respiratory tract infection (10%), bronchitis (9%), pharyngitis (8%), acute tonsillitis (6%), rhinitis (6%)

<1%, postmarketing, and/or case reports: Acute renal failure, agranulocytosis, anaphylaxis, angioedema, anxiety, ascites, bilirubin increased,

cataract, cholecystitis, cholelithiasis, constipation, cytopenias, dizziness, drug fever, duodenal ulcer, edema, erythema multiforme, esophagitis, gastric ulcer, gastritis, gastrointestinal bleeding, glomerulonephritis, glucosuria, hearing loss (including high frequency), hematuria, Henoch-Schönlein purpura, hepatic dysfunction, hepatic encephalopathy, hepatic failure (including fatalities), hepatic transaminases increased, hepatitis, hyperactivity, hypersensitivity reaction, insomnia, interstitial nephritis, intraocular pressure increased, jaundice, lens opacities, leukocytoclastic vasculitis, maculopathy, neutropenia, optic neuritis, pigment disorder, purpura, renal tubular necrosis, renal tubulopathy, retinal disorder, sleep disorder, thrombocytopenia, visual disturbance

Oncology: Emetic PotentialLow (10% to 30%)
Drug Interactions

Aluminum Hydroxide: May diminish the therapeutic effect of Deferasirox. *Risk D: Consider therapy modification*

CYP3A4 Substrates: Deferasirox may decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Monitoring Parameters

CBC with differential, serum creatinine (twice prior to initiation, then monthly thereafter; monitor patients with renal risk factors or with changes in therapy weekly for the first month and then monthly thereafter, urine protein (monthly), liver function tests (monthly), and serum ferritin (monthly); baseline and annual auditory and ophthalmic function (including slit lamp exam and dilated fundoscopy)

Nursing: Physical Assessment/MonitoringAssess hearing and vision prior to initiating therapy and periodically during treatment. Monitor lab results as indicated. Observe for skin rash. Mild-to-moderate rashes will usually resolve spontaneously. Assess for signs of liver dysfunction (eg, unusual fatigue, easy bruising or bleeding, jaundice) and renal dysfunction (eg, unusual weight gain, swelling of extremities, decrease in urine output). Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.
Monitoring: Lab Tests

CBC with differential, serum creatinine (twice prior to initiation, then monthly thereafter; monitor patients with renal risk factors or with changes in therapy weekly for the first month and then monthly thereafter, urine protein (monthly), liver function tests (monthly), and serum ferritin (monthly); baseline and annual auditory and ophthalmic function (including slit lamp exam and dilated fundoscopy)

Patient EducationTake on an empty stomach at least 30 minutes prior to eating. Do not chew or swallow whole. Disperse in water, orange juice, or apple juice and drink immediately. Any residue remaining should be resuspended in a small volume of liquid and swallowed. Do not take with antacids. Maintain adequate hydration (2-3 L/day) unless instructed to restrict intake by prescriber. You may experience a fever, headache, abdominal pain, nausea, diarrhea, cough, sore throat, or dizziness (use caution when driving or engaging in activities requiring alertness until response to drug is known). Report severe rashes, changes in vision or hearing, weight gain >5 pounds/week, swelling of extremities, decrease in urine output, shortness of breath, unusual bleeding or bruising, change in color of urine or stool, yellowing of skin or eyes, or unusual fatigue. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, for oral suspension:

Exjade®: 125 mg, 250 mg, 500 mg

Generic AvailableNo
ManufacturerNovartis
Mechanism of ActionSelectively binds iron, forming a complex which is excreted primarily through the feces.
Pharmacodynamics/Kinetics

Distribution: Adults: 11.7-17.1 L

Protein binding: ~99% to serum albumin

Metabolism: Hepatic via glucuronidation by UGT1A1(primarily) and UGT1A3; minor oxidation by CYP450; undergoes enterohepatic recirculation

Bioavailability: 70%

Half-life elimination: 8-16 hours

Time to peak, plasma: ~1.5 hours

Excretion: Feces (84%), urine (8%)

Pharmacotherapy PearlsDeferasirox has a low affinity for binding with zinc and copper, may cause variable decreases in the serum concentration of these trace minerals.

Oncology Comment: The National Comprehensive Cancer Network (NCCN) guidelines for myelodysplastic syndromes (MDS) recommend iron chelation therapy in relatively low-risk MDS patients to reverse adverse effects (on cardiac, hepatic and endocrine function) from chronic iron overload due to multiple transfusions. Treatment is generally recommended in MDS patients who have received ≥20 units of RBC transfusions and for those with serum ferritin levels >2500 mcg/L. Although clinical trials in MDS are ongoing, deferasirox may be useful in the management of iron overload of these patients.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or fatigue; may rarely cause anxiety, hyperactivity, or insomnia
Mental Health: Effects on Psychiatric TreatmentAssociated with dose-related skin rash; monitor patients receiving anticonvulsants (especially lamotrigine). GI side effects are common; concomitant use with SSRIs, lithium, valproic acid, and carbamazepine may produce additive effects.

Medication Safety Issues

Sound-alike/look-alike issues:

Deferoxamine may be confused with cefuroxime, deferasirox

Desferal® may be confused with desflurane, Dexferrum®, Disophrol®

International issues:

Desferal® may be confused with Deseril® which is a brand name for methysergide in multiple international markets

Pronunciation(de fer OKS a meen)
U.S. Brand NamesDesferal®
Canadian Brand NamesDesferal®; PMS-Deferoxamine
Pharmacologic CategoryAntidote; Chelating Agent
Use: Labeled IndicationsAcute iron intoxication or when clinical signs of significant iron toxicity exist; chronic iron overload secondary to multiple transfusions
Use: Unlabeled/InvestigationalRemoval of corneal rust rings following surgical removal of foreign bodies; diagnosis or treatment of aluminum induced toxicity associated with chronic kidney disease (CKD)
Dosing: Adults
Acute iron toxicity:

I.M., I.V.: Initial: 1000 mg, may be followed by 500 mg every 4 hours for up to 2 doses; subsequent doses of 500 mg have been administered every 4-12 hours

Maximum recommended dose: 6 g/day (per manufacturer, however, higher doses have been administered)

Note: I.V. route is used when severe toxicity is evidenced by systemic symptoms (coma, shock, metabolic acidosis, or severe gastrointestinal bleeding) or potentially severe intoxications (serum iron level >500 mcg/dL). When severe symptoms are not present, the I.M. route may be preferred (per manufacturer); however, the use of deferoxamine in situations where the serum iron concentration is <500 mcg/dL or when severe toxicity is not evident is a subject of some clinical debate.

Chronic iron overload:

I.M., I.V.: 500-1000 mg/day I.M.; in addition, 2000 mg should be given I.V. with each unit of blood transfused (administer separately from blood); maximum: 1 g/day in absence of transfusions; 6 g/day if patient received transfusions

SubQ: 1-2 g every day or 20-40 mg/kg/day over 8-24 hours

Diagnosis of aluminum induced toxicity with CKD (unlabeled use): I.V.: Test dose: 5 mg/kg during the last hour of dialysis if serum aluminum levels are 60-200 mcg/L and there are clinical signs/symptoms of toxicity. Do not use if aluminum serum levels are >200 mcg/L

Treatment of aluminum toxicity with CKD (unlabeled use): I.V.: 5-10 mg/kg 4-6 hours before dialysis. Administer every 7-10 days with 3-4 dialysis procedures between doses. Do not use if aluminum serum levels are >200 mcg/L.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric
Acute iron toxicity: Children ≥3 years: Refer to "Note" in adult dosing.

I.M.: 90 mg/kg/dose every 8 hours (maximum: 6 g/24 hours)

I.V.: 15 mg/kg/hour (maximum: 6 g/24 hours)

Chronic iron overload: Children ≥3 years:

SubQ: 20-40 mg/kg/day over 8-12 hours (maximum: 1000-2000 mg/day)

I.V.: 15 mg/kg/hour (maximum: 6 g/24 hours)

Diagnosis of aluminum induced toxicity with CKD (unlabeled use): Children ≥3 years: Refer to adult dosing.

Treatment of aluminum toxicity with CKD (unlabeled use): Children ≥3 years: Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Administer 50% of dose.
Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Urticaria, hypotension, and shock have occurred following rapid I.V. administration; limiting infusion rate to 15mg/kg/hour may help avoid infusion-related adverse effects.

Acute iron toxicity: The manufacturer states that the I.M. route is preferred; however, the I.V. route is generally preferred in patients with severe toxicity (ie, patients in shock). For the first 1000 mg, infuse at 15 mg/kg/hour (although rates up to 40-50 mg/kg/hour have been given in patients with massive iron intoxication). Subsequent doses may be given over 4-12 hours at a rate not to exceed 125 mg/hour.

Diagnosis or treatment of aluminum induced toxicity with CKD: Administer dose over 1 hour

Administration: OtherSubQ: When administered for chronic iron overload, daily dose should be given over 8-24 hours using portable pump.

Dietary ConsiderationsVitamin C supplements may need to be limited. The manufacturer recommends a maximum of 200 mg/day in adults (given in divided doses) and avoiding use in patients with heart failure.

StoragePrior to reconstitution, do not store above 25˚C (77˚F). Following reconstitution, may be stored at room temperature for 7 days; protect from light. Do not refrigerate reconstituted solution.

Reconstitution

I.M.: Reconstitute with sterile water for injection (500 mg vial with 2 mL to a final concentration of 210 mg/mL; 2000 mg vial with 8 mL to a final concentration of 213 mg/mL)

I.V.: Reconstitute with sterile water for injection to a final solution of 100 mg/mL

SubQ: Reconstitute with sterile water for injection (500 mg vial with 5 mL; 2000 mg vial with 20 mL) to a final concentration of 95 mg/mL

CompatibilityStable in D_5W, LR, NS, sterile water for injection.

ContraindicationsHypersensitivity to deferoxamine or any component of the formulation; patients with severe renal disease or anuria, primary hemochromatosis

Allergy Considerations

- Deferoxamine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adult respiratory distress syndrome (ARDS): Has been associated with ARDS following excessively high-dose treatment of acute intoxication or thalassemia; has also been reported in children.
- Auditory effects: Auditory disturbances have been reported following prolonged administration at high doses, or in patients with low ferritin levels; elderly patients are at increased risk.
- CNS effects: High doses may exacerbate neurological symptoms, including seizure in patients with aluminum-related encephalopathy.
- Dialysis dementia: Associated with dialysis dementia onset.
- Growth retardation: High doses and low ferritin levels are also associated with growth retardation.
- Hypocalcemia: Treatment in patients with aluminum toxicity may cause hypocalcemia and aggravate hyperparathyroidism.
- Infection: Patients with iron overload are at increased susceptibility to infection with *Yersinia enterocolitica* and *Yersinia pseudotuberculosis;* treatment with deferoxamine may enhance this risk; if infection develops, discontinue therapy until resolved.
- Infusion reactions: Flushing, hypotension, urticaria and shock are associated with rapid infusions.
- Mucormycosis: Rare and serious cases of mucormycosis have been reported with use; withhold treatment with signs and symptoms of mucormycosis.
- Ocular effects: Ocular disturbances have been reported following prolonged administration at high doses, or in patients with low ferritin levels; elderly patients are at increased risk.

Concurrent drug therapy issues:

- Ascorbic acid: Combination treatment with ascorbic acid may impair cardiac function (rare). If combination treatment is warranted, therapy may need adjusted; monitor cardiac function. Do not administer deferoxamine in combination with ascorbic acid in patients with pre-existing cardiac failure.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 years of age.

Other warnings/precautions:

- Urine discoloration: Patients should be informed that urine may have a reddish color.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSkeletal anomalies and delayed ossification were observed in some but not all animal studies. Toxic amounts of iron or deferoxamine have not been noted to cross the placenta. In case of acute toxicity, treatment during pregnancy should not be withheld.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Flushing, hypotension, tachycardia, shock, edema

Central nervous system: Fever, dizziness, neuropathy, seizure, exacerbation of aluminum-related encephalopathy (dialysis), headache

Dermatologic: Angioedema, rash, urticaria

Endocrine & metabolic: Growth retardation (children), hypocalcemia

Gastrointestinal: Abdominal discomfort, abdominal pain, diarrhea, nausea, vomiting

Genitourinary: Dysuria

Hematologic: Thrombocytopenia, leukopenia

Local: Injection site: Burning, crust, edema, erythema, eschar, induration, infiltration, irritation, pain, pruritus, swelling, vesicles, wheal formation

Neuromuscular & skeletal: Arthralgia, leg cramps, metaphyseal dysplasia (dose related), myalgia, paresthesia

Ocular: Acuity decreased, blurred vision, dichromatopsia, maculopathy, night vision impaired, peripheral vision impaired, visual loss, scotoma, visual field defects, optic neuritis, cataracts, retinal pigmentary abnormalities, night blindness

Otic: Hearing loss, tinnitus

Renal: Renal impairment, urine discoloration (vin-rose color)

Respiratory: Acute/adult respiratory distress syndrome, asthma

Miscellaneous: Anaphylaxis, hypersensitivity reaction, infections (*Yersinia*, mucormycosis)

Drug Interactions

Ascorbic Acid: May enhance the adverse/toxic effect of Deferoxamine. Left ventricular dysfunction is of particular concern. *Risk D: Consider therapy modification*

Test InteractionsTIBC may be falsely elevated with high serum iron concentrations or deferoxamine therapy. Imaging results may be distorted due to rapid urinary excretion of deferoxamine-bound gallium-67; discontinue deferoxamine 48 hours prior to scintigraphy.

Monitoring ParametersSerum iron; ophthalmologic exam (fundoscopy, slit-lamp exam) and audiometry with chronic therapy; growth and body weight in children (every 3 months)

Dialysis patients: Serum aluminum (yearly; every 3 months in patients on aluminum-containing medications)

Aluminum-induced bone disease: Serum aluminum 2 days following test dose; test is considered positive if serum aluminum increases ≥50 mcg/L

Reference Range

Iron, serum: Normal: 50-150 mcg/dL; levels >500 mcg/dL associated with toxicity. Consider treatment with symptomatic patients with levels ≥350 mcg/dL; toxicity cannot be excluded with serum iron levels <350 mcg/dL

Aluminum, serum: <20 mcg/L recommended baseline level in dialysis patients

Nursing: Physical Assessment/MonitoringMonitor laboratory tests. Infuse slowly and monitor infusion site. Monitor for acute reactions; urticaria, hypotension and shock can occur following rapid I.V. administration. With chronic therapy, perform ophthalmologic exam (fundoscopy, slit-lamp exam) and audiometry. Teach patient proper use, including injection technique and syringe/needle disposal. Monitor for adverse reactions (eg, cardiac, respiratory, or CNS symptoms) and teach patient importance of reporting adverse symptoms.

Monitoring: Lab TestsSerum iron, total iron-binding capacity

Patient EducationInstructions depend on patient condition. You will be monitored closely for effects of this medication and frequent blood or urine tests may be necessary. Your urine may show a reddish discoloration. Report chest pain, rapid heartbeat, headache, pain, swelling, or irritation at infusion site; skin rash; changes or loss of hearing or vision; or acute abdominal or leg cramps. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as mesylate: 500 mg, 2 g

Desferal®: 500 mg, 2 g

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Desferal)

500 mg (4): $84.55

Mechanism of ActionComplexes with trivalent ions (ferric ions) to form ferrioxamine, which are removed by the kidneys

Pharmacodynamics/Kinetics

Absorption: I.M.: Erratic

Metabolism: Plasma enzymes; binds with iron to form ferrioxamine

Half-life elimination: Parent drug: 6.1 hours; Ferrioxamine: 5.8 hours

Excretion: Primarily urine (as unchanged drug and ferrioxamine); feces (via bile)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentLoss of consciousness has been reported with concurrent use of prochlorperazine

Index TermsDeferoxamine Mesylate; Desferrioxamine; NSC-644468

Degarelix

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Degarelix may be confused with cetrorelix, ganirelix

Pronunciation(deg a REL ix)

Pharmacologic CategoryAntineoplastic Agent, Gonadotropin-Releasing Hormone Antagonist; Gonadotropin Releasing Hormone Antagonist

Use: Labeled IndicationsTreatment of advanced prostate cancer

Dosing: Adults**Prostate cancer:** SubQ:

Loading dose: 240 mg administered as two 120 mg (3 mL) injections

Maintenance dose: 80 mg every 28 days (beginning 28 days after initial loading dose)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <50 mL/minute: Use with caution.

Dosing: Hepatic Impairment

Mild-to-moderate hepatic impairment: No adjustment required; monitor serum testosterone levels.

Severe hepatic impairment: Has not been studied; use with caution.

Administration: I.V.Not for I.V. use.

Administration: OtherNot for I.V. use. Administer SubQ in the abdominal area by grasping skin and elevating SubQ tissue; inject at an angle ≤45 degrees. Avoid pressure exposed areas (eg, waistband, near ribs); rotate injection site. Inject loading dose as two 3 mL injections (40 mg/mL); maintenance dose should be administered as one 4mL injection (20 mg/mL); begin maintenance dose 28 days after initial loading dose.

Dietary ConsiderationsSupplementation with 500 mg calcium and 400 int. units of vitamin D is recommended (due to the increased risk for osteoporosis with androgen deprivation therapy).

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ReconstitutionUse appropriate precautions (wear gloves for preparation and administration) for handling and disposal. Reconstitute with preservative free sterile water for injection (reconstitute each 120 mg vial with 3 mL; reconstitute the 80 mg vial with 4.2 mL). Swirl gently; do not shake (to prevent foaming). Dissolution may take up to 15 minutes. Keep vial upright at all times. Tilt vial slightly, keeping needle in lowest section of vial to withdraw for administration. Administer within 1 hour of reconstitution.

ContraindicationsHypersensitivity to degarelix or any component of the formulation; pregnancy (or potential to become pregnant)

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Decreased bone mineral density: Androgen deprivation therapy is associated with decreased bone mineral density.
- QT prolongation: Androgen deprivation therapy may prolong the QT interval. Use with caution in patients with a known history of QT prolongation or other risk factors for QT prolongation (eg, concomitant use of medications known to prolong QT interval, heart failure, and/or electrolyte abnormalities).

Disease-related concerns:

- Cardiovascular disease: Androgen deprivation therapy may increase the risk for cardiovascular disease.
- Diabetes: Androgen deprivation therapy may cause obesity and insulin resistance; the risk for diabetes is increased.
- Hepatic impairment: Degarelix exposure is decreased in patients with hepatic impairment, dosage adjustment is not recommended in patients with mild-to-moderate hepatic impairment, although testosterone levels should be monitored. Has not been studied in patients with severe hepatic impairment; use with caution.
- Renal Impairment: Data for use in patients with moderate-to-severe renal impairment (Cl_{cr} <50 mL/minute) is limited; use with caution.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorX

Pregnancy ConsiderationsAnimal studies have demonstrated embryo and fetal loss. Use is contraindicated in women who are or may become pregnant.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Endocrine & metabolic: Hot flashes (26%)

Local: Injections site reactions (35%, grade 3: ≤2%; pain 28%, erythema 17%, swelling 6%, induration 4%, nodule 3%)

1% to 10%:

Cardiovascular: Hypertension (6%)

Central nervous system: Chills (5%), dizziness (1% to 5%), fever (1% to 5%), headache (1% to 5%), insomnia (1% to 5%), fatigue (3%)

Dermatologic: Hyperhydrosis

Endocrine & metabolic: Hypercholesterolemia (3%), gynecomastia, testicular atrophy

Gastrointestinal: Weight gain (9%), constipation (5%), nausea (1% to 5%), diarrhea

Genitourinary: Urinary tract infection (5%), erectile dysfunction

Hepatic: ALT increased (10%; grade 3: <1%), AST increased (5%; grade 3: <1%), GGT increased

Neuromuscular & skeletal: Back pain (6%), arthralgia (5%), weakness (1% to 5%)

Miscellaneous: Antidegarelix antibody formation (10%), night sweats (1% to 5%)

<1%, postmarketing, and/or case reports: Bone metastases worsening, cerebral stroke, depression, injection site pruritus, injection site soreness, lymphoma (malignant), mental status changes, MI, osteoarthritis, QT interval prolongation, squamous cell cancer, unstable angina

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Test InteractionsSuppression of pituitary-gonadal function may affect diagnostic tests of pituitary gonadotropic and gonadal functions.

Monitoring ParametersProstate-specific antigen (PSA) periodically, serum testosterone levels (if PSA increases; in patients with hepatic impairment: monitor testosterone levels monthly until achieve castration levels, then consider monitoring every other month), liver function tests (at baseline), serum electrolytes (calcium, magnesium, potassium, sodium); bone mineral density

Screen for diabetes and cardiovascular risk prior to initiating treatment.

Monitoring: Lab TestsProstate-specific antigen (PSA) periodically, serum testosterone levels (if PSA increases; in patients with hepatic impairment: monitor testosterone levels monthly until achieve castration levels, then consider monitoring every other month), liver function tests (at baseline), serum electrolytes (calcium, magnesium, potassium, sodium); bone mineral density

Product AvailabilityDegarelix (brand name pending): FDA approved December 2008; availability anticipated towards the end of 2009

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as acetate: 80 mg, 120 mg

Generic AvailableNo

ManufacturerFerring Pharmaceuticals, Inc

Mechanism of ActionGonadotropin-releasing hormone (GnRH) antagonist which reversibly binds to GnRH receptors in the anterior pituitary gland, blocking the receptor and decreasing secretion of luteinizing hormone (LH) and follicle stimulation hormone (FSH), resulting in rapid androgen deprivation by decreasing testosterone production, thereby decreasing testosterone levels. Testosterone levels do not exhibit an initial surge, or flare, as is typical with GnRH agonists.

Pharmacodynamics/Kinetics

Onset of action: Rapid; ~96% of patients had testosterone levels ≤50 ng/dL within 3 days (Klotz, 2008)

Distribution: V_d: >1000 L

Protein binding: ~90%

Metabolism: Hepatobiliary, via peptide hydrolysis

Bioavailability: Biphasic release: Rapid release initially, then slow release from depot formed after subcutaneous injection administration (Tornoe, 2007)

Half-life elimination: Loading dose: SubQ: ~53 days

Time to peak, plasma: Loading dose: SubQ: Within 2 days

Excretion: Feces (~70% to 80%, primarily as peptide fragments); urine (~20% to 30%)

Dental Health Professional ConsiderationsDegarelix is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Degarelix is considered as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. It is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsDegarelix may prolong QT interval; it is suggested that the clinician consult with the physician prior to use of vasoconstrictor in suspected patients; use vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) with caution.

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, or fatigue; rarely associated with depression

Mental Health: Effects on Psychiatric TreatmentMay prolong QT interval; use caution with paliperidone and ziprasidone. May cause weight gain and insulin resistance; concomitant use with atypical antipsychotics may produce additive effects.

Index TermsDegarelix Acetate; FE200486

Delavirdine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(de la VIR deen)
U.S. Brand NamesRescriptor®
Canadian Brand NamesRescriptor®
Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Non-nucleoside)
Use: Labeled IndicationsTreatment of HIV-1 infection in combination with at least two additional antiretroviral agents
Dosing: AdultsHIV-1 infection (part of combination): Oral: 400 mg 3 times/day
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

HIV-1 infection (part of combination): Adolescents ≥16 years: Refer to adult dosing.

Administration: OralPatients with achlorhydria should take the drug with an acidic beverage. Antacids and delavirdine should be separated by 1 hour. A dispersion of delavirdine may be prepared by adding four 100 mg tablets to at least 3 oz of water. Allow to stand for a few minutes and stir until uniform dispersion. Drink immediately. Rinse glass and mouth, then swallow the rinse to ensure total dose administered. The 200 mg tablets should be taken intact.
Dietary ConsiderationsMay be taken without regard to food.
StorageStore at 20°C to 25°C (68°F to 77°F). Protect from humidity.
Extemporaneously PreparedA dispersion of delavirdine may be prepared by adding four 100 mg tablets to at least 3 oz of water; allow to stand for a few minutes and stir until uniform dispersion; drink immediately; rinse glass and mouth following ingestion to ensure total dose administered
ContraindicationsHypersensitivity to delavirdine or any component of the formulation; concurrent use of alprazolam, cisapride, ergot alkaloids, midazolam, pimozide, rifampin, or triazolam
Warnings/Precautions

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Rash: Occurs frequently, may require discontinuation of therapy; usually occurs within 1-3 weeks and lasts <2 weeks. Most patients may resume therapy following a treatment interruption.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- HIV: Appropriate use: Due to rapid emergence of resistance, delavirdine should not be used as monotherapy; cross-resistance may be conferred to other non-nucleoside reverse transcriptase inhibitors, although potential for cross-resistance with protease inhibitors is low.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Long-term effects: The long-term effects of delavirdine are not known.

Pregnancy Risk FactorC
Pregnancy ConsiderationsIt is not known if delavirdine crosses the human placenta. Delavirdine was shown to be teratogenic in some animal studies. There are no adequate and well-controlled studies in pregnant women and use during pregnancy is not recommended unless other alternatives are not available. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions

Frequency of adverse reactions reported from occurrence in clinical trials with delavirdine when used as part of combination antiretroviral therapy.

>10%:

Central nervous system: Headache (19% to 20%), depressive symptoms (10% to 15%), fever (4% to 12%)

Dermatologic: Rash (16% to 32%)

Gastrointestinal: Nausea (20% to 25%), vomiting (3% to 11%)

1% to 10%:

Central nervous system: Anxiety (6% to 8%)

Endocrine & metabolic: Transaminases increased (2% to 5%), amylase increased (3%), bilirubin increased (2%)

Gastrointestinal: Diarrhea, vomiting, abdominal pain (4% to 6%)

Hematologic: Prothrombin time increased (2%), hemoglobin decreased (1% to 3%)

Respiratory: Bronchitis (6% to 8%)

Frequency not defined (limited to important or life threatening): Abscess, adenopathy, alkaline phosphatase increased, allergic reaction, angioedema, anorexia, arrhythmia, bloody stool, bone pain, bruising, cardiac insufficiency, cardiac rate abnormal, cardiomyopathy, chest congestion, cognitive impairment, colitis, confusion, conjunctivitis, dermal leukocytoclastic vasculitis, desquamation, diverticulitis, dyspnea, emotional lability, eosinophilia, erythema multiforme, fecal incontinence, fungal dermatitis, gamma glutamyl transpeptidase increased, gastroenteritis, gastrointestinal bleeding, granulocytosis, gum hemorrhage, hallucination, hematuria, hepatomegaly, hyperglycemia, hyperkalemia, hypertension, hypertriglyceridemia, hyperuricemia, hypocalcemia, hyponatremia, hypophosphatemia, infection, jaundice, kidney pain, leukopenia, lipase increased, menstrual irregularities, moniliasis (oral/vaginal), pancreatitis, pancytopenia, paralysis, peripheral vascular disorder, pneumonia, postural hypotension, purpura, redistribution of body fat, renal calculi, serum creatinine increased, spleen disorder, Stevens-Johnson syndrome, tetany, thrombocytopenia, urinary tract infection, vertigo

Postmarketing and/or case reports: Acute renal failure, hemolytic anemia, hepatic failure, immune reconstitution syndrome, rhabdomyolysis

Metabolism/Transport Effects

Substrate of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C9 (strong), 2C19 (strong), 2D6 (strong), 3A4 (strong)

Drug Interactions

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amprenavir: May decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Amprenavir. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Etravirine: Reverse Transcriptase Inhibitors (Non-Nucleoside) may decrease the serum concentration of Etravirine. This has been observed with the NNRTIs efavirenz and nevirapine. Reverse Transcriptase Inhibitors (Non-Nucleoside) may increase the serum concentration of Etravirine. This has been observed with delavirdine. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fosamprenavir: May decrease the serum concentration of Delavirdine. The active metabolite amprenavir is likely responsible for this effect. Delavirdine may increase the serum concentration of Fosamprenavir. Specifically, delavirdine may increase concentrations of the active metabolite amprenavir. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: Delavirdine may decrease the metabolism of Rifamycin Derivatives. Rifamycin Derivatives may increase the metabolism of Delavirdine. *Risk D: Consider therapy modification*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Delavirdine serum concentration may be decreased by St John's wort; avoid concurrent use.

Monitoring ParametersLiver function tests if administered with saquinavir

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions or toxicity; dosing adjustments may be necessary. A list of medications that should not be used is available in each bottle and patients should be provided with this information. Assess effectiveness of therapy (decrease in infections and progress of disease; viral load and CD4 count) and adverse reactions periodically during therapy. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions, and adverse symptoms to report (eg, rash, gastrointestinal upset).

Monitoring: Lab TestsLiver function tests if administered with saquinavir; viral load

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescriptions, over-the-counter medications, or herbal products (even if they are not on the list) without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed for full course of therapy. May be taken with or without food. Do not take antacids within 1 hour of delavirdine. Take 200 mg tablets intact (do not chew or dissolve). You may mix four 100 mg tablets in 3-5 oz of water, allow to stand a few minutes and stir; drink immediately; rinse glass and mouth (swallow rinse solution) following ingestion to ensure total dose administered. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection; avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber. Frequent blood tests may be required with prolonged therapy. May cause nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Consult prescriber if nausea or vomiting persists. Report skin rash or irritation, muscle weakness, persistent headache, fatigue or gastrointestinal upset. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as mesylate: 100 mg, 200 mg

Generic AvailableNo

ManufacturerPharmacia & Upjohn

Pricing: U.S. (www.drugstore.com)

Tablets (Rescriptor)

200 mg (30): $53.99

Mechanism of ActionDelavirdine binds directly to reverse transcriptase, blocking RNA-dependent and DNA-dependent DNA polymerase activities

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: Low concentration in saliva and semen; CSF 0.4% concurrent plasma concentration

Protein binding: ~98%, primarily albumin

Metabolism: Hepatic via CYP3A4 and 2D6 (**Note:** May reduce CYP3A activity and inhibit its own metabolism.)

Bioavailability: Tablet: 85% as tablet; ~100% as oral slurry

Half-life elimination: 5.8 hours (range: 2-11 hours)

Time to peak, plasma: 1 hour

Excretion: Urine (51%, <5% as unchanged drug); feces (44%); nonlinear kinetics exhibited

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Pharmacotherapy PearlsPotential compliance problems, frequency of administration, and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentFluoxetine may increase plasma concentrations of delavirdine; carbamazepine and phenobarbital may decrease plasma concentrations of delavirdine; delavirdine may increase concentrations of alprazolam, midazolam, and triazolam

Index TermsU-90152S

Demeclocycline

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(dem e kloe SYE kleen)
U.S. Brand NamesDeclomycin®
Canadian Brand NamesDeclomycin®
Pharmacologic CategoryAntibiotic, Tetracycline Derivative
Use: Labeled IndicationsTreatment of susceptible bacterial infections (acne, gonorrhea, pertussis and urinary tract infections) caused by both gram-negative and gram-positive organisms
Use: Unlabeled/InvestigationalTreatment of chronic syndrome of inappropriate secretion of antidiuretic hormone (SIADH)
Dosing: Adults

Susceptible infections: Oral: 150 mg 4 times/day or 300 mg twice daily

SIADH (unlabeled use): Oral: 900-1200 mg/day or 13-15 mg/kg/day divided every 6-8 hours initially, then decrease to 600-900 mg/day

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricSusceptible infections: Oral: ≥8 years: 8-12 mg/kg/day divided every 6-12 hours
Dosing: Renal ImpairmentShould be avoided in patients with renal dysfunction.
Dosing: Hepatic ImpairmentShould be avoided in patients with hepatic dysfunction.
Administration: OralAdminister 1 hour before or 2 hours after food or milk with plenty of fluid.
Dietary ConsiderationsShould be taken 1 hour before or 2 hours after food or milk with plenty of fluid.
StorageTetracyclines form toxic products when outdated or when exposed to light, heat, or humidity (Fanconi-like syndrome).
ContraindicationsHypersensitivity to demeclocycline, tetracyclines, or any component of the formulation; children <8 years of age; concomitant use with methoxyflurane; pregnancy
Allergy Considerations

- Tetracycline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Increased BUN: May be associated with increases in BUN secondary to antianabolic effects; use caution in patients with renal impairment.
- Nephropathy: Outdated drug can cause nephropathy.
- Photosensitivity: May cause photosensitivity; discontinue if skin erythema occurs. Use skin protection and avoid prolonged exposure to sunlight; do not use tanning equipment.
- Pseudotumor cerebri: Has been (rarely) reported with tetracycline use; usually resolves with discontinuation.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Special populations:

- Pediatrics: May cause tissue hyperpigmentation, enamel hypoplasia, or permanent tooth discoloration; use of tetracyclines should be avoided during tooth development (children ≤8 years of age) unless other drugs are not likely to be effective or are contraindicated. However, recommended in treatment of anthrax exposure.
- Pregnancy: Do not use during pregnancy. In addition to affecting tooth development, tetracycline use has been associated with retardation of skeletal development and reduced bone growth.

Geriatric ConsiderationsHas not been studied exclusively in the elderly.
Pregnancy Risk FactorD
Pregnancy ConsiderationsDemeclocycline has been shown to cross the placenta in rats and other tetracyclines cross the placenta in humans causing permanent discoloration of teeth if used during the second or third trimester. Because use during pregnancy may cause fetal harm, demeclocyline is classified as pregnancy category D.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsDemeclocycline has been shown to cause tooth discolorations in newborn rats when exposed to high doses, but not low doses via breast milk. Other tetracyclines are excreted in breast milk. There is no data on the amount of demeclocycline that is

excreted in human breast milk. Breast-feeding is not recommended by the manufacturer.

Tetracyclines, including demeclocycline, bind to calcium. The calcium in maternal milk will significantly decrease the amount of demeclocycline absorbed by the breast-feeding infant. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Demeclocycline in Pregnancy & Lactation

Adverse Reactions

Frequency not defined.

Cardiovascular: Pericarditis

Central nervous system: Bulging fontanels (infants), dizziness, headache, pseudotumor cerebri (adults)

Dermatologic: Angioneurotic edema, erythema multiforme, erythematous rash, maculopapular rash, photosensitivity, pigmentation of skin, Stevens-Johnson syndrome (rare), urticaria

Endocrine & metabolic: Discoloration of thyroid gland (brown/black), nephrogenic diabetes insipidus

Gastrointestinal: Anorexia, diarrhea, dysphagia, enterocolitis, esophageal ulcerations, glossitis, nausea, pancreatitis, vomiting

Genitourinary: Balanitis

Hematologic: Eosinophilia, neutropenia, hemolytic anemia, thrombocytopenia

Hepatic: Hepatitis (rare), hepatotoxicity (rare), liver enzymes increased, liver failure (rare)

Neuromuscular & skeletal: Myasthenic syndrome, polyarthralgia, tooth discoloration (children <8 years, rarely in adults)

Ocular: Visual disturbances

Otic: Tinnitus

Renal: Acute renal failure

Respiratory: Pulmonary infiltrates

Miscellaneous: Anaphylaxis, anaphylactoid purpura, lupus-like syndrome, systemic lupus erythematosus exacerbation

Drug Interactions

Antacids: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth Subsalicylate: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Desmopressin: Demeclocycline may diminish the therapeutic effect of Desmopressin. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Tetracycline Derivatives may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Penicillins: Tetracycline Derivatives may diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Quinapril: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: Tetracycline Derivatives may enhance the adverse/toxic effect of Retinoic Acid Derivatives. The development of pseudotumor cerebri is of particular concern. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Tetracycline Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Tetracycline Derivatives. Only a concern when both products are administered orally. **Exceptions:** Zinc Chloride. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Demeclocycline serum levels may be decreased if taken with food.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization).

Test InteractionsMay interfere with tests for urinary glucose (false-negative urine glucose using Clinistix®, Tes-Tape®)

Monitoring ParametersCBC, renal and hepatic function

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to beginning therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, increased risk of toxicity or decreased effectiveness). Assess results of laboratory tests, therapeutic response, and adverse effects (eg, rash, anaphylactic reactions, anemia, CNS changes) on a regular basis throughout therapy. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC, renal and hepatic function; perform culture and sensitivity studies prior to initiating therapy

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Take on an empty stomach (1 hour before or 2 hours after meals with plenty of fluid). Take at regularly scheduled intervals around-the-clock. Avoid antacids, iron, dairy products, and other medications within 2 hours of taking demeclocycline. May cause photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); dizziness or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea or vomiting (frequent, small meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (buttermilk, yogurt, or boiled milk may help). Report rash or intense itching, yellowing of skin or eyes, change in color of urine or stools, fever or chills, dark urine or pale stools, vaginal itching or discharge, foul-smelling stools, excessive thirst or urination, acute headache, unresolved or persistent diarrhea, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptives. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 150 mg, 300 mg

Declomycin®: 150 mg, 300 mg

Generic AvailableYes

ManufacturerLederle Laboratories

Pricing: U.S. (www.drugstore.com)

Tablets (Declomycin)

150 mg (30): $329.99

300 mg (48): $978.05

Mechanism of ActionInhibits protein synthesis by binding with the 30S and possibly the 50S ribosomal subunit(s) of susceptible bacteria; may also cause alterations in the cytoplasmic membrane; inhibits the action of ADH in patients with chronic SIADH

Pharmacodynamics/Kinetics

Onset of action: SIADH: Several days

Absorption: ~50% to 80%; reduced by food and dairy products

Protein binding: 41% to 50%

Metabolism: Hepatic (small amounts) to inactive metabolites; undergoes enterohepatic recirculation

Half-life elimination: 10-17 hours

Time to peak, serum: 3-6 hours

Excretion: Urine (42% to 50% as unchanged drug)

Dental Health: Effects on Dental TreatmentTetracyclines are not recommended for use during pregnancy or in children ≤8 years of age since they have been reported to cause enamel hypoplasia and permanent teeth discoloration. Tetracyclines should only be used in these patients if other agents are contraindicated or alternative antimicrobials will not eradicate the organism. Long-term use associated with oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease the effects of demeclocycline. May cause photosensitivity and other dermatological reactions; consider this possibility when individuals are also taking psychotropics (eg, antipsychotics, carbamazepine, lamotrigine) since they may produce similar reactions.

Index TermsDemeclocycline Hydrochloride; Demethylchlortetracycline

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(de ni LOO kin DIF ti toks)

U.S. Brand NamesONTAK®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous

Use: Labeled IndicationsTreatment of persistent or recurrent cutaneous (peripheral) T-cell lymphoma (CTCL) whose malignant cells express the CD25 component of the IL-2 receptor

Use: Unlabeled/InvestigationalTreatment of CTCL types mycosis fungoides (MF) and Sézary syndrome (SS)

Dosing: Adults**Note:** Premedicate with an antihistamine and acetaminophen prior to each infusion; withhold treatment if serum albumin <3 g/dL.

Persistent or recurrent cutaneous T-cell lymphoma: I.V.: 9 or 18 mcg/kg/day days 1 through 5 every 21 days for 8 cycles.

Dosing: ElderlyRefer to adult dosing.

Dosing: Adjustment for Toxicity

Serum albumin <3 g/dL: Withhold treatment

Severe infusion reaction: Permanently discontinue treatment

Administration: I.V.For I.V. use only. Infuse over 30-60 minutes. Should **not** be given as a rapid I.V. bolus. Discontinue or reduce infusion rate for infusion related reactions; discontinue for severe infusion reaction. Do not administer through an in-line filter. Premedicate with an antihistamine and acetaminophen.

Administration: I.V. DetailpH: 6.9-7.2

StorageStore intact vials frozen at or below -10°C (14°F); do not refreeze after thawing. Solutions ≥15 mcg/mL in NS should be used within 6 hours.

ReconstitutionMust be brought to room temperature (25°C or 77°F) before preparing the dose. Do **not** heat vials. Thaw in refrigerator for not more than 24 hours or at room temperature for 1-2 hours. Solution may be mixed by gentle swirling; avoid vigorous agitation. Dilute with NS to a concentration of ≥15 mcg/mL; the concentration must be ≥15 mcg/mL during all steps of preparation. Add drug to the empty sterile I.V. bag first, then add NS. Do not prepare with glass syringes or in glass containers.

ContraindicationsThere are no contraindications listed within the manufacturer’s labeling.

Warnings/Precautions

Boxed warnings:

- Capillary leak syndrome: See “Concerns related to adverse effects” below.
- Infusion reactions: See “Concerns related to adverse effects” below.
- Visual loss: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Capillary leak syndrome: **[U.S. Boxed Warning]: Has been associated with a potentially severe, including life-threatening, capillary leak syndrome; monitor weight, edema, blood pressure, and serum albumin prior to and during treatment.** Symptoms of capillary leak syndrome (hypotension, edema, hypoalbuminemia) may be delayed, occurring up to 2 weeks postinfusion; symptoms may persist or worsen after cessation of denileukin diftitox. Withhold treatment if serum albumin <3 g/dL; pre-existing low serum albumin levels may correlate with capillary leak syndrome.

- Infusion reactions: **[U.S. Boxed Warning]: Serious and fatal infusion reactions have occurred. Administer in a facility appropriate for cardiopulmonary resuscitation. Discontinue immediately and permanently with serious infusion reaction.** Infusion reaction symptoms usually occur within 24 hours of infusion and resolve within 48 hours of last infusion of cycle. Incidence of infusion reaction has been reported to be lower in cycles 3 and 4 (compared to cycles 1 and 2).

- Immunogenicity: May develop immunogenicity; patients with antibodies have a two- to threefold increase in clearance. The presence of antibodies does not correlate with risk for hypersensitivity/infusion related reactions.

- Infection: Monitor closely for infection; may impair immune function; patients with CTCL are predisposed to cutaneous infection.

- Visual loss: **[U.S. Boxed Warning]: Loss of visual acuity, usually associated with loss of color vision (with or without retinal pigment mottling) has been reported.** Most patients have persistent visual impairment.

Special populations:

- Elderly: Use with caution in patients >65 years of age; adverse events (anemia, anorexia, confusion, hypotension, rash, nausea/vomiting) may occur more frequently.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Confirm CD25 expression on malignant cells prior to treatment.

- Experienced physician: Should be administered under the supervision of an experienced cancer chemotherapy physician.

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Should be given to a pregnant woman only if clearly needed

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsThe excretion of denileukin diftitox in breast milk is unknown, however, it is recommended that a breast-feeding woman who is treated with denileukin diftitox should discontinue nursing.

Adverse Reactions

>10%:

Cardiovascular: Capillary leak syndrome (33%; serious: 11%), peripheral edema (20% to 26%), vasodilation (22%), hypotension (7% to 16%), chest pain (4% to 13%), tachycardia (12%), thrombosis-related events (7% to 11%)

Central nervous system: Fever (49% to 64%), fatigue (44% to 47%), headache (26% to 29%), dizziness (11% to 13%), pain (11% to 13%)

Dermatologic: Rash (20% to 24%), pruritus (16% to 18%)

Endocrine & metabolic: Hypoalbuminemia (14% to 17%)

Gastrointestinal: Nausea (47% to 60%), vomiting (13% to 35%), diarrhea (22%), anorexia (9% to 20%), taste disturbance (11% to 13%)

Hematologic: Lymphopenia (70%; 24% had lymphopenia at baseline)

Hepatic: ALT increased (84%), AST increased (84%)

Neuromuscular & skeletal: Rigors (42% to 47%), myalgia (18% to 20%), weakness (18%), back pain (16% to 18%), arthralgia (13% to 16%)

Respiratory: Cough (18% to 20%), upper respiratory infection (13%), dyspnea (11% to 13%)

Miscellaneous: Antibody formation (76% to 100%) neutralizing antibodies (45% to 97%), flu-like syndrome (≤85%), infusion reaction (71%; serious: 8%), infection (48%)

1% to 10%:

Cardiovascular: Arrhythmia (6%), hypertension (6%)

Hematologic: Leukopenia (grades 3/4: 3% to 6%), neutropenia (grades 3/4: 3%), thrombocytopenia (grades 3/4: 3%)

Local: Injection site reaction (8%)

Ocular: Visual changes (serious: 4%; includes loss of visual acuity)

Renal: Serum creatinine increased (3% to 10%), proteinuria/casts/hematuria (6%)

Postmarketing and/or case reports: Acute renal insufficiency, hyper-/hypothyroidism, oral ulcer, pancreatitis, thyroiditis, thyrotoxicosis, toxic epidermal necrolysis

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersBaseline CD25 expression (on malignant cells); serum albumin level (prior to each treatment), CBC, blood chemistry panel, renal and hepatic function tests (prior to initiation of therapy and weekly during therapy). During the infusion, the patient should be monitored for symptoms of an infusion reaction. After infusion, the patient should be monitored for the development of a delayed capillary leak syndrome (usually in the first 2 weeks), including careful monitoring of weight, blood pressure, and serum albumin.

Information on assay for malignant cell CD25 expression is available at 1-877-873-4724.

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests prior to therapy and weekly during therapy. Patient must be monitored closely for acute hypersensitivity reaction during and for 24 hours following first infusion. Following infusion, patient should be monitored or taught to monitor for delayed vascular leak syndrome (eg, hypotension, edema, or hypoalbuminemia) and other adverse reactions. Teach patient appropriate interventions to reduce side effects and adverse reactions to report.

Monitoring: Lab TestsBaseline CD25 expression (on malignant cells); serum albumin level (prior to each treatment), CBC, blood chemistry panel, renal and hepatic function tests (prior to initiation of therapy and weekly during therapy). Information on assay for malignant cell CD25 expression is available at 1-877-873-4724.

Patient EducationThis medication can only be administered via intravenous infusion. During infusion, report immediately any chills; chest pain, respiratory difficulty, or tightness in throat; or redness, swelling, pain, or burning at infusion site. Maintaining adequate nutrition and hydration is important (2-3 L/day) unless instructed to restrict fluid intake. You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea, vomiting, anorexia, flatulence (small, frequent meals, good mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, boiled milk, or yogurt may help); headache, back or muscle pain (consult prescriber for mild analgesic); dizziness, weakness, or confusion (use caution when driving, engaging in hazardous activities, or climbing stairs until effect of medication is known). Report unresolved GI effects; headache, back or muscle pain; skin dryness, rash, or sores; altered urinary patterns; flu syndrome or infection (eg, weakness, fatigue, white plaques or sores in mouth, vaginal discharge, chills, fever); CNS disturbances (insomnia, dizziness, agitation, confusion, depression); unusual bleeding or bruising, blood in urine or stool; swelling of extremities; or any other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [frozen]:

ONTAK®: 150 mcg/mL (2 mL) [contains EDTA]

Generic AvailableNo

Mechanism of ActionDenileukin diftitox is a fusion protein (a combination of amino acid sequences from diphtheria toxin and interleukin-2) which selectively delivers the cytotoxic activity of diphtheria toxin to targeted cells. It interacts with the high-affinity IL-2 receptor on the surface of malignant cells to inhibit intracellular protein synthesis, rapidly leading to cell death.

Pharmacodynamics/Kinetics

Distribution: V_d: 0.06-0.09 L/kg

Metabolism: Hepatic via proteolytic degradation (animal studies)

Half-life elimination: Distribution: 2-5 minutes; Terminal: 70-80 minutes

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy Pearls**Oncology Comment:** The National Comprehensive Cancer Network (NCCN) Non-Hodgkin's Lymphoma Guidelines (v.3.2008) list denileukin diftitox as a second-line treatment option for systemic therapy of peripheral (cutaneous) T-cell lymphoma in patients who are not candidates for high dose therapy or autologous stem cell rescue. In mycosis fungoides (MF) and Sézary syndrome (SS), denileukin diftitox is a therapy option, either as monotherapy or in combination with bexarotene; participation in a clinical trial is encouraged for this patient population.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and nervousness are common; may cause insomnia or confusion

Mental Health: Effects on Psychiatric TreatmentHypotension and tachycardia are common; use caution with low potency antipsychotics and other psychotropics. Nausea and vomiting are common; use caution with SSRIs.

Index TermsDAB389 Interleukin-2; DAB$_{389}$IL-2; NSC-714744

Desflurane

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Desflurane may be confused with Desferal®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(DES flure ane)
U.S. Brand NamesSuprane®
Canadian Brand NamesSuprane®
Pharmacologic CategoryGeneral Anesthetic, Inhalation
Use: Labeled IndicationsInduction and maintenance of general anesthesia (adults); maintenance of anesthesia (intubated children)
Dosing: AdultsInhalation: The minimum alveolar concentration (MAC), the concentration at which 50% of patients do not respond to surgical incision, ranges from 6.0% (45 years of age) to 7.3% (25 years of age). The concentration at which amnesia and loss of awareness occur (MAC - awake) is 2.4%. Surgical levels of anesthesia are achieved with concentrations between 2.5% to 8.5%.

Note: Because of the higher vapor pressure of desflurane, its vaporizer is heated in order to deliver a constant concentration

Dosing: ElderlyMAC is reduced (5.2% at 70 years of age).
Dosing: PediatricAnesthesia maintenance: Children (intubated): Surgical levels of anesthesia range between 5.2% to 10%

Note: Because of the higher vapor pressure of desflurane, its vaporizer is heated in order to deliver a constant concentration

Administration: InhalationVia desflurane-specific calibrated heated vaporizer
ContraindicationsHypersensitivity to desflurane, other halogenated anesthetic agents, or any component of the formulation; known or suspected history of malignant hyperthermia
Warnings/Precautions

Concerns related to adverse effects:

- Decreased blood flow: May cause decrease in hepatic and/or renal blood flow.
- Hepatitis: May cause sensitivity hepatitis in patients who have been sensitized by previous exposure to halogenated anesthetics.
- Hyperkalemia: Use of other inhaled anesthetics has been associated with rare cases of perioperative hyperkalemia; concomitant use of succinylcholine was associated with many of the reported cases, but not all. Risk of hyperkalemia is increased in pediatric patients with underlying neuromuscular disease (eg, Duchenne muscular dystrophy). Other abnormalities may include elevation in CPK and myoglobinuria. Monitor closely for arrhythmias. Aggressively identify and treat hyperkalemia.
- Increased intracranial pressure: May dilate the cerebral vasculature and may, in certain conditions, increase intracranial pressure.
- Malignant hyperthermia: May trigger malignant hyperthermia; avoid use in patients susceptible to malignant hyperthermia.
- Respiratory depression: Causes dose-dependent respiratory depression and blunted ventilatory response to hypoxia and hypercapnia. Hypoxic pulmonary vasoconstriction is blunted which may lead to increased pulmonary shunt. May produce elevated carbon monoxide levels in the presence of a dry carbon dioxide absorbent within the circle breathing system of an anesthetic machine; maintain fresh absorbent as per manufacturer guidelines regardless of state of colorimetric indicator.

Disease-related concerns:

- Cardiovascular disease: Do not use as a single agent to induce anesthesia in patients with CAD or in whom an increase in heart rate or blood pressure should be avoided. Abrupt increases in inspired concentrations >1 MAC can produce a transient increase in blood pressure and heart rate due to increased plasma catecholamine levels. Hypotensive effect due to peripheral vasodilation is dose dependent and increases as anesthesia is deepened.

Special populations:

- Pediatrics: Due to higher incidences of airway irritation (eg, laryngospasm, coughing, breath-holding, increased secretions) in pediatric patients, avoid use to induce and/or maintain anesthesia in nonintubated pediatric patients.

Pregnancy Risk FactorB
Pregnancy ConsiderationsNo adverse events were seen in animal studies. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution

Breast-Feeding Considerations Due to rapid washout, desflurane levels in milk most likely have no clinical importance 24 hours after anesthesia.

Adverse Reactions

>10%:

- Gastrointestinal: Nausea (27%), vomiting (16%)
- Respiratory: Cough (3% to 34%), breath-holding (>1% to 30%), apnea (3% to 15%)

1% to 10%:

- Cardiovascular: Bradycardia, hyper-/hypotension, nodal arrhythmia, tachycardia
- Central nervous system: Emergence delirium, headache
- Gastrointestinal: Salivation increased
- Ocular: Conjunctivitis
- Respiratory: Secretions increased (3% to 10%), laryngospasm (3% to 10%), oxyhemoglobin desaturation (3% to 10%), pharyngitis (>1% to 10%)
- Miscellaneous: Shivering

<1% (Limited to important or life-threatening): Agitation, arrhythmia, asthma, bigeminy, dizziness, dyspnea, ECG changes, hemorrhage, hepatic failure, hepatic necrosis, hepatitis, hyperkalemia, hypoxia, malignant hyperthermia, MI, myocardial ischemia, myalgia, pruritus, vasodilation

Drug Interactions

EPINEPHrine: Inhalational Anesthetics may enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Methylphenidate: May enhance the hypertensive effect of Inhalational Anesthetics. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): Inhalational Anesthetics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Monitoring Parameters Blood pressure, heart rate and rhythm, temperature, oxygen saturation, end-tidal CO_2 and end-tidal desflurane concentrations should be monitored prior to and throughout anesthesia

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, for inhalation:

- Suprane®: 100% (240 mL) [amber bottle]

Generic Available No

Pharmacodynamics/Kinetics

Onset of action: 1-2 minutes

Duration: Emergence time: Depends on blood concentration when desflurane is discontinued

- The rate of change of anesthetic concentration in the lung is more rapid with desflurane because of its low blood/gas solubility (0.42), which is similar to nitrous oxide.

Metabolism: Hepatic (0.02%)

Excretion: Exhaled gases

Pharmacotherapy Pearls Desflurane has the lowest fat-to-blood solubility of the inhaled anesthetics (desflurane, enflurane, isoflurane, sevoflurane); may be useful in obese patients who are undergoing anesthesia for longer procedures (>2 hours).

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause delirium

Mental Health: Effects on Psychiatric Treatment Hypotension is common; concomitant use with psychotropics may produce additive effects; monitor

Anesthesia and Critical Care Concerns/Other Considerations Use of desflurane for induction of general anesthesia is not recommended due to its irritant properties and unpleasant odor which may cause breath holding and coughing.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children’s Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

Desipramine may be confused with clomiPRAMINE, deserpidine, diphenhydrAMINE, disopyramide, imipramine, nortriptyline

Norpramin® may be confused with clomiPRAMINE, imipramine, Norpace®, nortriptyline, Tenormin®

International issues:

Norpramin®: Brand name for omeprazole in Spain

Pronunciation(des IP ra meen)

U.S. Brand NamesNorpramin®

Canadian Brand NamesAlti-Desipramine; Apo-Desipramine®; Norpramin®; Nu-Desipramine; PMS-Desipramine

Pharmacologic CategoryAntidepressant, Tricyclic (Secondary Amine)

Use: Labeled IndicationsTreatment of depression

Use: Unlabeled/InvestigationalAnalgesic adjunct in chronic pain; peripheral neuropathies; substance-related disorders (eg, cocaine withdrawal); attention-deficit/hyperactivity disorder (ADHD); depression in children ≤12 years of age

Dosing: Adults

Depression: Oral: Initial: 75 mg/day in divided doses; increase gradually to 150-200 mg/day in divided or single dose; maximum: 300 mg/day

Cocaine withdrawal (unlabeled use): 50-200 mg/day in divided or single dose

Dosing: ElderlyOral: Initial: 10-25 mg/day; increase by 10-25 mg every 3 days for inpatients and every week for outpatients if tolerated; usual maintenance dose: 75-100 mg/day, but doses up to 150 mg/day may be necessary.

Dosing: PediatricDepression: Oral:

Children 6-12 years (unlabeled use): 10-30 mg/day or 1-3 mg/kg/day in divided doses; do not exceed 5 mg/kg/day

Adolescents: Initial: 25-50 mg/day; gradually increase to 100 mg/day in single or divided doses; maximum: 150 mg/day

Dosing: Renal ImpairmentHemodialysis/peritoneal dialysis effects: Supplemental dose is not necessary.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to desipramine, drugs of similar chemical class, or any component of the formulation; use of MAO inhibitors within 14 days; use in a patient during the acute recovery phase of MI; concurrent use of thioridazine

Allergy Considerations

- Tricyclic Antidepressant and Related Compounds Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Desipramine is FDA approved for the treatment of depression in adolescents.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Desipramine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is low relative to other antidepressants.

- Hematologic effects: TCAs may rarely cause bone marrow suppression; monitor for any signs of infection and obtain CBC if symptoms (eg, fever, sore throat) evident.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is moderate relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is low-moderate relative to other antidepressants.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk of conduction abnormalities with this agent is moderate relative to other antidepressants.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose regulation.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation due to concerns of pro-arrhythmogenesis.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be at greater risk of falling or confusional states.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Discontinuation of therapy: Recommended to discontinue prior to elective surgery requiring general anesthesia. Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

⇧ Geriatric ConsiderationsPreferred agent because of its milder side effect profile; patients may experience excitation or stimulation, in such cases, administer as a single morning dose or divided dose. Data from a clinical trial comparing fluoxetine to tricyclics suggest that fluoxetine is significantly less effective than nortriptyline in hospitalized elderly patients with unipolar major affective disorder, especially those with melancholia and concurrent cardiovascular disease.
⇧ Pregnancy Risk FactorC
⇧ LactationEnters breast milk/not recommended (AAP rates “of concern”)
⇧ Breast-Feeding ConsiderationsGenerally, it is not recommended to breast-feed if taking antidepressants because of the long half-life, active metabolites, and the potential for side effects in the infant.
⇧ Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, edema, flushing, heart block, hyper-/hypotension, MI, palpitation, stroke, tachycardia

Central nervous system: Agitation, anxiety, ataxia, confusion, delirium, disorientation, dizziness, drowsiness, drug fever, exacerbation of psychosis, extrapyramidal symptoms, fatigue, hallucinations, headache, hypomania, incoordination, insomnia, nervousness, parkinsonian syndrome, restlessness, seizure

Dermatologic: Alopecia, itching, petechiae, photosensitivity, skin rash, urticaria

Endocrine & metabolic: Breast enlargement, galactorrhea, hyper-/hypoglycemia, impotence, libido changes, SIADH

Gastrointestinal: Abdominal cramps, anorexia, black tongue, constipation, decreased lower esophageal sphincter tone may cause GE reflux, diarrhea, heartburn, nausea, paralytic ileus, stomatitis, unpleasant taste, vomiting, weight gain/loss, xerostomia

Genitourinary: Difficult urination, polyuria, sexual dysfunction, testicular edema, urinary retention

Hematologic: Agranulocytosis, eosinophilia, purpura, thrombocytopenia

Hepatic: Cholestatic jaundice, hepatitis, liver enzymes increased

Neuromuscular & skeletal: Fine muscle tremor, numbness, paresthesia of extremities, peripheral neuropathy, tingling, weakness

Ocular: Blurred vision, disturbances of accommodation, intraocular pressure increased, mydriasis

Otic: Tinnitus

Miscellaneous: Allergic reaction, diaphoresis (excessive)

Metabolism/Transport Effects **Substrate** of CYP1A2 (minor), 2D6 (major); **Inhibits** CYP2A6 (moderate), 2B6 (moderate), 2D6 (moderate), 2E1 (weak), 3A4 (moderate)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inhibitors (Moderate) may decrease the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inhibitors (Moderate) may decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Grapefruit juice may inhibit the metabolism of some TCAs and clinical toxicity may result.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersMonitor blood pressure and pulse rate prior to and during initial therapy; evaluate mental status, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased); monitor weight; ECG in older adults and those patients with cardiac disease; blood levels are useful for therapeutic monitoring

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008); ensure PR interval ≤200 ms, QRS duration ≤120 ms, and QT_c ≤460 ms.

Reference Range

Plasma levels do not always correlate with clinical effectiveness

Timing of serum samples: Draw trough just before next dose

Therapeutic: 50-300 ng/mL

In elderly patients the response rate is greatest with steady-state plasma concentrations >115 ng/mL

Possible toxicity: >300 ng/mL

Toxic: >1000 ng/mL

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Monitor CNS status. Assess for suicidal tendencies before beginning therapy, during initiation of therapy, or following an increase or decrease of dosage. May cause physiological or psychological dependence, tolerance, or abuse; periodically evaluate need for continued use. Caution patients with diabetes to monitor glucose levels closely; may increase or decrease serum glucose levels. Assess therapeutic response and adverse reactions at beginning of therapy and periodically with long-term use. Taper dose slowly when discontinuing. Teach patient proper use, appropriate interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. This medicine may cause physical and/or psychological dependence. Avoid alcohol and grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); loss of appetite or disturbed taste (small frequent meals, good mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); urinary retention (void before taking medication); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report chest pain, palpitations, or rapid heartbeat; persistent adverse CNS effects (eg, suicidal ideation, nervousness, restlessness, insomnia, anxiety, excitation, headache, agitation, impaired coordination, changes in cognition); muscle cramping, weakness, tremors, or rigidity; blurred vision or eye pain; breast enlargement or swelling; yellowing of skin or eyes; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended..

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg

Norpramin®: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg [contains soy oil]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Desipramine HCl)

10 mg (60): $19.99

25 mg (60): $20.99

50 mg (60): $28.99

75 mg (60): $32.99

150 mg (30): $29.99

Tablets (Norpramin)

10 mg (60): $61.84

25 mg (60): $74.85

50 mg (60): $135.62

75 mg (60): $170.34

100 mg (30): $110.46

150 mg (30): $162.74

Mechanism of ActionTraditionally believed to increase the synaptic concentration of norepinephrine (and to a lesser extent, serotonin) in the central nervous system by inhibition of its reuptake by the presynaptic neuronal membrane. However, additional receptor effects have been found including desensitization of adenyl cyclase, down regulation of beta-adrenergic receptors, and down regulation of serotonin receptors.

Pharmacodynamics/Kinetics

Onset of action: 1-3 weeks; Maximum antidepressant effect: >2 weeks

Absorption: Well absorbed

Metabolism: Hepatic

Half-life elimination: Adults: 7-60 hours

Time to peak, plasma: 4-6 hours

Excretion: Urine (70%)

Pharmacotherapy PearlsLess sedation and anticholinergic effects than with amitriptyline or imipramine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), unpleasant taste, stomatitis, and black tongue. Long-term treatment with TCAs increases the risk of caries by reducing salivation and salivary buffer capacity.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine and levonordefrin have been shown to have an increased pressor response in combination with TCAs. Desipramine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health CommentTricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Plasma concentrations correlate with clinical response. A linear relationship appears to exist. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal.

Anesthesia and Critical Care Concerns/Other ConsiderationsDesipramine causes less sedation and anticholinergic effects than with amitriptyline or imipramine.

Index TermsDesipramine Hydrochloride; Desmethylimipramine Hydrochloride

U.S. Brand NamesClarinex-D® 12 Hour; Clarinex-D® 24 Hour

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation

Use: Labeled IndicationsRelief of symptoms of seasonal allergic rhinitis, in children ≥12 years of age and adults

Dosing: AdultsSeasonal or allergic rhinitis: Oral:

Clarinex-D® 12 Hour: One tablet twice daily

Clarinex-D® 24 Hour: One tablet daily

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricSeasonal or allergic rhinitis: Oral: Children ≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Clarinex-D® 24 Hour: One tablet every other day

Clarinex-D® 12 Hour: Not recommended

Dosing: Hepatic ImpairmentNot recommended

Administration: OralTablet should be swallowed whole; do not break, crush, or chew. Administer with water.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 15°C to 30°C (59°F to 86°F). Heat sensitive; avoid exposure above 30°C (86°F).

ContraindicationsHypersensitivity to loratadine, desloratadine, pseudoephedrine, or any component of the formulation; narrow-angle glaucoma; urinary retention; during or within 14 days of MAO inhibitor therapy; severe hypertension or coronary artery disease; use in patients experiencing idiosyncratic reactions (eg, insomnia, tremor, dizziness) to adrenergic agents

Warnings/Precautions

Concerns related to adverse effects:

- CNS stimulation: May occur due to sympathomimetic amine (pseudoephedrine); seizures have been reported.
- Tachycardia: May occur due to sympathomimetic amine (pseudoephedrine); cardiovascular collapse with hypotension may also occur.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Hepatic impairment: Avoid use in patients with hepatic impairment.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia.
- Renal impairment: Avoid the use of Clarinex-D® 12 Hour. Use Clarinex-D® 24 Hour with caution in patients with renal impairment (dosage adjustments are recommended).
- Thyroid dysfunction: Use with caution in patients with hyperthyroidism.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects..
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. See individual agents.

LactationDesloratadine and pseudoephedrine enter breast milk/not recommended

Adverse ReactionsSee also individual agents. Percentages as reported with the combination products:

1% to 10%:

Central nervous system: Insomnia (5% to 10%), headache (6% to 8%), fatigue (3% to 4%), somnolence (3%), dizziness (2% to 3%), hyperactivity (2%), nervousness (2%)

Gastrointestinal: Xerostomia (8%), anorexia (2%), nausea (2%)

Respiratory: Pharyngitis (3%)

Miscellaneous: Infection (2%)

Postmarketing and/or case reports: Bilirubin increased, hepatitis (rare), hypersensitivity (rare), palpitation, tachycardia, transaminases increased

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Monitoring ParametersCreatinine clearance (pretreatment for product selection and dosing adjustment)

Monitoring: Lab TestsCreatinine clearance (pretreatment for product selection and dosing adjustment)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, variable release:

Clarinex-D® 12 Hour: Desloratadine 2.5 mg [immediate release] and pseudoephedrine 120 mg [extended release]

2.5-120 mg (100): $257.55

Tablet, 24-hour (Clarinex-D 24 Hour)

5-240 mg (30): $114.89

Mechanism of Action

Desloratadine, a major metabolite of loratadine, is a long-acting tricyclic antihistamine with selective peripheral histamine H_1 receptor antagonistic activity and additional anti-inflammatory properties.

Pseudoephedrine directly stimulates alpha-adrenergic receptors of respiratory mucosa causing vasoconstriction; directly stimulates beta-adrenergic receptors causing bronchial relaxation, increased heart rate and contractility.

Pharmacodynamics/KineticsAlso see individual agents.

Onset: Antihistaminic activity: 1 hour

Time to peak, plasma: Desloratadine: 4-7 hours; pseudoephedrine: 6-9 hours

U.S. Brand NamesClarinex®

Canadian Brand NamesAerius®

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation

Use: Labeled IndicationsRelief of nasal and non-nasal symptoms of seasonal allergic rhinitis (SAR) and perennial allergic rhinitis (PAR); treatment of chronic idiopathic urticaria (CIU)

Dosing: AdultsSeasonal or perennial allergic rhinitis, chronic idiopathic urticaria: Oral: 5 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricSeasonal or perennial allergic rhinitis, chronic idiopathic urticaria: Oral:

Children:

6-11 months: 1 mg once daily

12 months to 5 years: 1.25 mg once daily

6-11 years: 2.5 mg once daily

Children ≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Children: Not established

Adults: 5 mg every other day

Dosing: Hepatic Impairment5 mg every other day

Administration: OralMay be taken with or without food.

RediTabs® should be placed on the tongue; tablet will disintegrate immediately. May be taken with or without water.

Syrup: A commercially-available measuring dropper or syringe calibrated to deliver 2 mL or 2.5 mL should be used to administer age-appropriate doses in children.

Dietary ConsiderationsMay be taken with or without food. Orally-disintegrating tablets contain phenylalanine.

StorageSyrup, tablet, orally-disintegrating tablet: Store at 25°C (77°F); excursions permitted between 15°C to 30°C (59°F to 86°F). Protect from moisture and excessive heat (85°F). Use orally-disintegrating tablet immediately after opening blister package. Syrup should be protected from light.

ContraindicationsHypersensitivity to desloratadine, loratadine, or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment needed.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment needed.

Special populations:

- Pediatrics: Safety and efficacy have not been established for children <6 months of age.
- Slow metabolizers: Use with caution in patients known to be slow metabolizers of desloratadine (incidence of side effects may be increased).

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationEnters breast milk/not recommended

P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of sedation).

Food: Does not affect bioavailability.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake as directed; do not exceed recommended dose. Avoid use of other depressants, alcohol, or sleep-inducing medications unless approved by prescriber. You may experience headache, drowsiness, or dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or dry mouth, dry throat, or nausea (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report rapid heartbeat, shortness of breath, skin rash, persistent flu-like symptoms, or muscle aches. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup:

Clarinex®: 0.5 mg/mL (480 mL) [contains propylene glycol, sodium benzoate; bubble gum flavor]

Tablet:

Clarinex®: 5 mg

Tablet, orally disintegrating:

Clarinex® RediTabs®: 2.5 mg [contains phenylalanine 1.4 mg/tablet; tutti-frutti flavor]; 5 mg [contains phenylalanine 2.9 mg/tablet; tutti-frutti flavor]

Generic AvailableNo

ManufacturerSchering Corporation

Pricing: U.S. (www.drugstore.com)

0.5 mg/mL (473): $182.72

Tablet, orally-disintegrating (Clarinex Reditabs)

2.5 mg (30): $128.18

5 mg (30): $117.79

Tablets (Clarinex)

5 mg (30): $115.99

Mechanism of ActionDesloratadine, a major metabolite of loratadine, is a long-acting tricyclic antihistamine with selective peripheral histamine H_1 receptor antagonistic activity and additional anti-inflammatory properties.

Pharmacodynamics/Kinetics

Protein binding: Desloratadine: 82% to 87%; 3-hydroxydesloratadine: 85% to 89%

Metabolism: Hepatic to active metabolite, 3-hydroxydesloratadine (specific enzymes not identified); undergoes glucuronidation. Decreased in slow metabolizers of desloratadine. Not expected to affect or be affected by medications metabolized by CYP with normal doses.

Half-life elimination: 27 hours

Time to peak: 3 hours

Excretion: Urine and feces (as metabolites)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation, fatigue, or dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause nausea; concurrent use with SSRIs, lithium, and valproic acid may be additive

Special Alerts

Desmopressin: Health Canada Issues Warning Concerning Increased Risk of Hyponatremia Associated With Intranasal Use - July 2008

Ferring Pharmaceuticals, in conjunction with Health Canada, has issued a Dear Healthcare Professional letter to Canadian healthcare professionals regarding intranasal use of desmopressin and an increased risk of hyponatremia. This warning is similar to one recently announced by the U.S. Food and Drug Administration (FDA) in December, 2007.

Further information can be found at:

*Canada:*http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/desmopressin_hpc-cps-eng.php

*U.S.:*http://www.fda.gov/cder/drug/InfoSheets/HCP/desmopressinHCP.htm

Pronunciation(des moe PRES in)

U.S. Brand NamesDDAVP®; Stimate®

Canadian Brand NamesApo-Desmopressin®; DDAVP®; DDAVP® Melt; Minirin®; Novo-Desmopressin; Octostim®; PMS-Desmopressin

Pharmacologic CategoryAntihemophilic Agent; Hemostatic Agent; Vasopressin Analog, Synthetic

Use: Labeled Indications

Injection: Treatment of diabetes insipidus; maintenance of hemostasis and control of bleeding in hemophilia A with factor VIII coagulant activity levels >5% and mild-to-moderate classic von Willebrand's disease (type 1) with factor VIII coagulant activity levels >5%

Nasal solutions (DDAVP® Nasal Spray and DDAVP® Rhinal Tube): Treatment of central diabetes insipidus

Nasal spray (Stimate®): Maintenance of hemostasis and control of bleeding in hemophilia A with factor VIII coagulant activity levels >5% and mild to moderate classic von Willebrand's disease (type 1) with factor VIII coagulant activity levels >5%

Tablet: Treatment of central diabetes insipidus, temporary polyuria and polydipsia following pituitary surgery or head trauma, primary nocturnal enuresis

Use: Unlabeled/InvestigationalUremic bleeding associated with acute or chronic renal failure; prevention of surgical bleeding in patients with uremia

Dosing: Adults

Diabetes insipidus:

I.V., SubQ: U.S. labeling: 2-4 mcg/day (0.5-1 mL) in 2 divided doses or $^1/_{10}$ of the maintenance intranasal dose. Fluid restriction should be observed.

I.M., I.V., SubQ: Canadian labeling (not in U.S. labeling): 1-4 mcg (0.25-1 mL) once daily or $^1/_{10}$ of the maintenance intranasal dose. Fluid restriction should be observed.

Intranasal (100 mcg/mL nasal solution): 10-40 mcg/day (0.1-0.4 mL) divided 1-3 times/day; adjust morning and evening doses separately for an adequate diurnal rhythm of water turnover. **Note:** The nasal spray pump can only deliver doses of 10 mcg (0.1 mL) or multiples of 10 mcg (0.1 mL); if doses other than this are needed, the rhinal tube delivery system is preferred. Fluid restriction should be observed.

Oral:

U.S. labeling: Initial: 0.05 mg twice daily; total daily dose should be increased or decreased as needed to obtain adequate antidiuresis (range: 0.1-1.2 mg divided 2-3 times/day). Fluid restriction should be observed.

Canadian labeling (not in U.S. labeling): Initial: 0.1 mg 3 times/day; total daily dose should be increased or decreased as needed to obtain adequate antidiuresis (range: 0.3-1.2 mg divided 3 times/day). Fluid restriction should be observed.

Sublingual formulation: Canadian labeling (not in U.S. labeling): Initial: 60 mcg 3 times/day; total daily dose should be increased or decreased as needed to obtain adequate antidiuresis. Usual maintenance: 60-120 mcg 3 times/day (range: 120-720 mcg divided 2-3 times/day). Fluid restriction should be observed.

Nocturnal enuresis:*Oral:* 0.2 mg at bedtime; dose may be titrated up to 0.6 mg to achieve desired response.

Hemophilia A and mild-to-moderate von Willebrand disease (type 1):

I.V.: 0.3 mcg/kg by slow infusion; if used preoperatively, administer 30 minutes before procedure

Canadian labeling (not in U.S. labeling): Maximum I.V. dose: 20 mcg

Intranasal (using high concentration spray [1.5 mg/mL]): <50 kg: 150 mcg (1 spray); >50 kg: 300 mcg (1 spray each nostril); repeat use is determined by the patient's clinical condition and laboratory work. If using preoperatively, administer 2 hours before surgery.

Uremic bleeding associated with acute or chronic renal failure (unlabeled use) (Watson, 1984): I.V.: 0.4 mcg/kg over 10 minutes

Prevention of surgical bleeding in patients with uremia (unlabeled use) (Mannucci, 1983): I.V.: 0.3 mcg/kg over 30 minutes

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Diabetes insipidus:

I.M., I.V., SubQ: Canadian labeling (not in U.S. labeling): ≥3 months: 0.4 mcg (0.1 mL) once daily or $^1/_{10}$ of the maintenance intranasal dose. Fluid restriction should be observed.

I.V., SubQ:

Children <12 years: No definitive dosing available. Adult dosing should **not** be used in this age group; adverse events such as hyponatremia-induced seizures may occur. Dose should be reduced. Some have suggested an initial dosage range of 0.1-1 mcg in 1 or 2 divided doses (Cheetham, 2002). Initiate at low dose and increase as necessary. Closely monitor serum sodium levels and urine output; fluid restriction is recommended.

Children ≥12 years: Refer to adult dosing.

Intranasal (using 100 mcg/mL nasal solution):

3 months to 12 years: Initial: 5 mcg/day (0.05 mL/day) divided 1-2 times/day; range: 5-30 mcg/day (0.05-0.3 mL/day) divided 1-2 times/day; adjust morning and evening doses separately for an adequate diurnal rhythm of water turnover. **Note:** The nasal spray pump can only deliver doses of 10 mcg (0.1 mL) or multiples of 10 mcg (0.1 mL); if doses other than this are needed, the rhinal tube delivery system is preferred. Fluid restriction should be observed.

Children ≥12 years: Refer to adult dosing.

Oral:

U.S. labeling: ≥4 years: Initial: 0.05 mg twice daily; total daily dose should be increased or decreased as needed to obtain adequate antidiuresis (range: 0.1-1.2 mg divided 2-3 times/day). Fluid restriction should be observed.

Canadian labeling (not in U.S. labeling): ≥5 years: Initial: 0.1 mg 3 times/day; total daily dose should be increased or decreased as needed to obtain adequate antidiuresis (range: 0.3-1.2 mg divided 3 times/day). Divide daily doses so that the evening dose is 2 times higher than the morning or afternoon dose to ensure adequate antidiuresis during the night. Fluid restriction should be observed.

Sublingual formulation: Canadian labeling (not in U.S. labeling): ≥3 months: Initial: 60 mcg 3 times/day; total daily dose should be increased or decreased as needed to obtain adequate antidiuresis. Usual maintenance: 60-120 mcg 3 times/day (range: 120-720 mcg divided 2-3 times/day); divide daily doses so that the evening dose is 2 times higher than the morning or afternoon dose to ensure adequate antidiuresis during the night. Fluid restriction should be observed.

Hemophilia A and von Willebrand disease (type 1):

I.V.: ≥3 months: 0.3 mcg/kg by slow infusion; may repeat dose if needed; if used preoperatively, administer 30 minutes before procedure

Canadian labeling (not in U.S. labeling): Maximum I.V. dose: 20 mcg

Note: Adverse events such as hyponatremia-induced seizures have been reported especially in young children using this dosing regimen (Das, 2005; Molnar, 2005; Smith, 1989; Thumfart, 2005; Weinstein, 1989). Fluid restriction and careful monitoring of serum sodium levels and urine output are necessary.

Intranasal (using high concentration spray [1.5 mg/mL]): ≥11 months: Refer to adult dosing.

Nocturnal enuresis:

Oral:

Children ≥6 years: 0.2 mg at bedtime. Dose may be titrated up to 0.6 mg to achieve desired response. Fluid intake should be limited 1 hour prior to dose until the next morning, or at least 8 hours after administration. **Note:** In the Canadian labeling, use is approved for patients ≥5 years.

Children >12 years: Refer to adult dosing.

Sublingual: Canadian labeling (not in U.S. labeling): ≥5 years: Initial: 120 mcg at bedtime; dose may be titrated up to 360 mcg to achieve desired response. Fluid intake should be limited 1 hour prior to dose until the next morning, or at least 8 hours after administration.

Dosing: Renal ImpairmentCl$_{cr}$ <50 mL/minute: Use is contraindicated according to the manufacturer; however, has been used in acute and chronic renal failure patients experiencing uremic bleeding or for prevention of surgical bleeding (unlabeled uses; Mannuccio, 1983; Watson, 1984).

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Central diabetes insipidus: Withdraw dose from ampul into appropriate syringe size (eg, insulin syringe). Further dilution is not required. Administer as direct injection.

Administration: I.V.

I.V. push: Central diabetes insipidus: Withdraw dose from ampul into appropriate syringe size (eg, insulin syringe). Further dilution is not required. Administer as direct injection.

I.V. infusion:

Hemophilia A, von Willebrand disease (type 1), and prevention of surgical bleeding in patients with uremia (unlabeled; Mannucci, 1983): Infuse over 15-30 minutes

Acute uremic bleeding (unlabeled; Watson, 1984): May infuse over 10 minutes

Administration: Other

Intranasal:

DDAVP®: Nasal pump spray: Delivers 0.1 mL (10 mcg); for doses <10 mcg or for other doses which are not multiples, use rhinal tube. DDAVP® Nasal spray delivers fifty 10 mcg doses. For 10 mcg dose, administer in one nostril. Any solution remaining after 50 doses should be discarded. Pump must be primed prior to first use.

DDAVP® Rhinal tube: Insert top of dropper into tube (arrow marked end) in downward position. Squeeze dropper until solution reaches desired calibration mark. Disconnect dropper. Grasp the tube $^3/_4$ inch from the end and insert tube into nostril until the fingertips reach the nostril. Place opposite end of tube into the mouth (holding breath). Tilt head back and blow with a strong, short puff into the nostril (for very young patients, an adult should blow solution into the child's nose). Reseal dropper after use.

SubQ: Central diabetes insipidus: Withdraw dose from ampul into appropriate syringe size (eg, insulin syringe). Further dilution is not required. Administer as direct injection.

Storage

DDAVP®:

Nasal spray: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Keep nasal spray in upright position.

Rhinal Tube solution: Store refrigerated at 2°C to 8°C (36°F to 46°F). May store at controlled room temperature of 20°C to 25°C (68°F to 77°F) for up to 3 weeks.

Solution for injection: Store refrigerated at 2°C to 8°C (36°F to 46°F).

Tablet: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F).

DDAVP® Melt (CAN; not available in U.S.): Store at 15°C to 25°C (59°F to 77°F) in original container. Protect from moisture.

Stimate® nasal spray: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Keep nasal spray in upright position. Discard 6 months after opening.

ReconstitutionDDAVP®: Dilute solution for injection in 10-50 mL NS for I.V. infusion (10 mL for children ≤10 kg: 50 mL for adults and children >10 kg).

CompatibilityStable in NS.

ContraindicationsHypersensitivity to desmopressin or any component of the formulation; hyponatremia or a history of hyponatremia; moderate-to-severe renal impairment (Cl_{cr}<50 mL/minute)

Canadian labeling: Additional contraindications (not in U.S. labeling): Type 2B or platelet-type (pseudo) von Willebrand's disease (injection, intranasal, oral, sublingual); known hyponatremia, habitual or psychogenic polydipsia, cardiac insufficiency or other conditions requiring diuretic therapy (intranasal, sublingual); nephrosis, severe hepatic dysfunction (sublingual); primary nocturnal enuresis (intranasal)

Allergy Considerations

- Desmopressin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions (injectable and intranasal formulations): Severe reactions resembling hypersensitivity (eg, anaphylaxis) reactions have occurred rarely with I.V. and intranasal administration.
- Hyponatremia: Use may rarely lead to hyponatremia and extreme decreases in plasma osmolality, resulting in seizures, coma, and death. Risk factors for hyponatremia with desmopressin use include cystic fibrosis, renal dysfunction, heart failure, young age, advanced age, inappropriate high fluid intake with desmopressin administration, a larger than recommended dose, and concomitant use of medications known to either increase thirst or cause syndrome of inappropriate ADH secretion (SIADH). Fluid restriction during use is recommended.
- Thrombotic events: Acute cerebrovascular thrombosis and acute myocardial infarction have occurred (rare); use with caution in patients predisposed to thrombus formation.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery insufficiency or hypertensive cardiovascular disease; may increase or decrease blood pressure leading to changes in heart rate.

- Polydipsia (habitual or psychogenic): Use with caution in patients with habitual or psychogenic polydipsia. These patients are at greater risk of hyponatremia. Use in these patients is contraindicated in Canadian labeling.

- von Willebrand's disease type 2B: Patients with type 2B von Willebrand's disease requiring hemostasis should not be treated with desmopressin since use may result in platelet aggregation, thrombocytopenia, and possibly thrombosis.

Special populations:

- Elderly: Fluid intake should be adjusted downward in the elderly to decrease the possibility of water intoxication and hyponatremia.

- Pediatrics: Fluid intake should be adjusted downward in very young patients to decrease the possibility of water intoxication and hyponatremia.

Dosage form specific issues:

- Injection and high concentration spray (1.5 mg/mL): Not for use in hemophilia B, type 2B von Willebrand disease, severe classic von Willebrand disease (type 1), or in patients with factor VIII antibodies. In general, the injection and high concentration spray are also not recommended for use in patients with ≤5% factor VIII activity level, although it may be considered in selected patients with activity levels between 2% and 5%.

- Intranasal: Consider alternative route of administration (I.V.) if changes in the nasal mucosa (scarring, edema) occur leading to unreliable absorption.

- Tablet: Patients should be instructed to restrict fluid intake from 1 hour before to 8 hours after taking desmopressin tablets. Consider alternative route of administration (I.V. or intranasal) with inadequate therapeutic response at maximum recommended oral doses.

Appropriate use:

- Interruption of therapy: Therapy should be interrupted if the patient experiences an acute illness (eg, fever, recurrent vomiting or diarrhea), vigorous exercise, or any condition associated with an increase in water consumption.

Other warnings/precautions:

- Long-term effects: Some patients may demonstrate a change in response after long-term therapy (>6 months) characterized as decreased response or a shorter duration of response.

Geriatric ConsiderationsElderly patients should be cautioned not to increase their fluid intake beyond that sufficient to satisfy their thirst in order to avoid water intoxication and hyponatremia. Under experimental conditions, elderly have been shown to have a decreased responsiveness to vasopressin with respect to its effects on water homeostasis.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal reproductive studies. There are no adequate and well-controlled studies in pregnant women. Anecdotal reports suggest congenital anomalies and low birth weight. However, causal relationship has not been established. Desmopressin has been used safely during pregnancy.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency may not be defined (may be dose or route related).

Cardiovascular: Blood pressure increased/decreased (I.V.), facial flushing

Central nervous system: Headache (2% to 5%), dizziness (intranasal; ≤3%), chills (intranasal; 2%)

Dermatologic: Rash

Endocrine & metabolic: Hyponatremia, water intoxication

Gastrointestinal: Abdominal pain (intranasal; 2%), gastrointestinal disorder (intranasal; ≤2%), nausea (intranasal; ≤2%), abdominal cramps, sore throat

Hepatic: Transient increases in liver transaminases (associated primarily with tablets)

Local: Injection: Burning pain, erythema, and swelling at the injection site

Neuromuscular & Skeletal: Weakness (intranasal; ≤2%)

Ocular: Conjunctivitis (intranasal; ≤2%), eye edema (intranasal; ≤2%), lacrimation disorder (intranasal; ≤2%)

Respiratory: Rhinitis (intranasal; 3% to 8%), epistaxis (intranasal; ≤3%), nostril pain (intranasal; ≤2%), cough, nasal congestion, upper respiratory infection

<1%, postmarketing, and/or case reports: Acute cerebrovascular thrombosis (I.V.), acute MI (I.V.), agitation, allergic reactions (rare), anaphylaxis (rare), balanitis, chest pain, coma, diarrhea, dyspepsia, edema, insomnia, itching eyes, light-sensitive eyes, pain, palpitation, seizure, somnolence, tachycardia, thinking abnormal, vomiting, vulval pain, warmth

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Analgesics (Opioid): May enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

CarBAMazepine: May enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

ChlorproMAZINE: May enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Demeclocycline: May diminish the therapeutic effect of Desmopressin. *Risk C: Monitor therapy*

LamoTRIgine: May enhance the adverse/toxic effect of Desmopressin. LamoTRIgine may enhance the therapeutic effect of Desmopressin. *Risk C: Monitor therapy*

Lithium: May diminish the therapeutic effect of Desmopressin. Desmopressin may increase the serum concentration of Lithium. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may decrease antidiuretic effect).

Monitoring ParametersBlood pressure and pulse should be monitored during I.V. infusion

Note: For all indications, fluid intake, urine volume, and signs and symptoms of hyponatremia should be closely monitored especially in high-risk patient subgroups (eg, young children, elderly, patients with heart failure).

Diabetes insipidus: Urine specific gravity, plasma and urine osmolality, serum electrolytes

Hemophilia A: Factor VIII coagulant activity, factor VIII ristocetin cofactor activity, and factor VIII antigen levels, aPTT

von Willebrand disease: Factor VIII coagulant activity, factor VIII ristocetin cofactor activity, and factor VIII von Willebrand antigen levels, bleeding time

Nocturnal enuresis: Serum electrolytes if used for >7 days

Nursing: Physical Assessment/MonitoringEvaluate for any history of or potential for hyponatremia or renal impairment prior to beginning therapy. Assess results of laboratory tests on a regular basis during therapy. Assess therapeutic effectiveness (according to rationale for use) and adverse reactions (eg, thromboembolism, hyponatremia, water intoxication) regularly throughout therapy. Teach patient proper use (if self-administered), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsFor all indications, fluid intake, urine volume, and signs and symptoms of hyponatremia should be closely monitored especially in high-risk patient subgroups (eg, young children, elderly, patients with heart failure).

Diabetes insipidus: Urine specific gravity, plasma and urine osmolality, serum electrolytes

Hemophilia A: Factor VIII coagulant activity, factor VIII ristocetin cofactor activity, and factor VIII antigen levels, aPTT

von Willebrand disease: Factor VIII coagulant activity, factor VIII ristocetin cofactor activity, and factor VIII von Willebrand antigen levels, bleeding time

Nocturnal enuresis: Serum electrolytes if used for >7 days

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Use specific product as directed. Avoid alcohol; may decrease effect of medication. Diabetes insipidus: Avoid overhydration. Weigh yourself daily at the same time in the same clothes. Report increased weight or swelling of extremities. If using intranasal product, inspect nasal membranes regularly. Report swelling, redness, irritation, or increased nasal congestion.

All uses: Report unresolved headache; chest pain or palpitation; respiratory difficulty; acute heartburn, nausea, vomiting, or abdominal cramping; vulval pain; CNS changes (agitation, chills, coma, dizziness, insomnia, confusion); rash; or other adverse effects. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian product

Injection, solution, as acetate: 4 mcg/mL (1 mL, 10 mL)

DDAVP®: 5 mcg/mL (1 mL, 10 mL)

Solution, intranasal, as acetate: 100 mcg/mL (2.5 mL)

DDAVP®: 100 mcg/mL (2.5 mL) [contains benzalkonium chloride; with rhinal tube]

Solution, as acetate, intranasal [spray]: 100 mcg/mL (5 mL)

DDAVP®: 100 mcg/mL (5 mL) [contains benzalkonium chloride; delivers 10 mcg/spray]

Stimate®: 1.5 mg/mL (2.5 mL) [delivers 150 mcg/spray]

Tablet, as acetate, oral: 0.1 mg, 0.2 mg

DDAVP®: 0.1 mg, 0.2 mg [scored]

Tablet, as acetate, sublingual:

DDAVP® Melt (CAN) [not available in U.S.]: 60 mcg, 120 mcg, 240 mcg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (DDAVP)

0.01% (5): $208.44

4 mcg/mL (10): $372.11

Solution (DDAVP Rhinal Tube)

0.01% (2.5): $121.54

Solution (Desmopressin Ace Rhinal Tube)

0.01% (2.5): $85.99

Solution (Desmopressin Ace Spray Refrig)

0.01% (5): $107.99

Tablets (DDAVP)

0.1 mg (30): $119.34

0.2 mg (30): $145.89

Tablets (Desmopressin Acetate)

0.1 mg (30): $86.99

0.2 mg (90): $325.99

Mechanism of ActionIn a dose dependent manner, desmopressin increases cyclic adenosine monophosphate (cAMP) in renal tubular cells which increases water permeability resulting in decreased urine volume and increased urine osmolality; increases plasma levels of von Willebrand factor, factor VIII, and t-PA contributing to a shortened activated partial thromboplastin time (aPTT) and bleeding time.

Pharmacodynamics/Kinetics

Onset of action:

Intranasal: Antidiuretic: 15-30 minutes; Increased factor VIII and von Willebrand factor (vWF) activity (dose related): 30 minutes

Peak effect: Antidiuretic: 1 hour; Increased factor VIII and vWF activity: 1.5 hours

I.V. infusion: Increased factor VIII and vWF activity: 30 minutes (dose related)

Peak effect: 1.5-2 hours

Oral tablet: Antidiuretic: ~1 hour

Peak effect: 4-7 hours

Duration of action: Intranasal, I.V. infusion, Oral tablet: ~6-14 hours

Absorption: Sublingual: Rapid

Bioavailability: Intranasal: ~3.5%; Oral tablet: 5% compared to intranasal, 0.16% compared to I.V.

Half-life elimination: Intranasal: ~3.5 hours; I.V. infusion: 3 hours; Oral tablet: 2-3 hours

Renal impairment: ≤9 hours

Excretion: Urine

Pharmacotherapy Pearls10 mcg of desmopressin acetate is equivalent to 40 int. units

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay decrease lithium's effect on ADH, however, hydrochlorothiazide or amiloride are better choices

Cardiovascular ConsiderationsWhen administered I.V., desmopressin is a vasoconstrictor and may cause acute hypertension.

Anesthesia and Critical Care Concerns/Other ConsiderationsIf desmopressin I.V. is given preoperatively, administer 30 minutes prior to surgery. If desmopressin intranasal is given preoperatively, administer 2 hours prior to surgery.

Index Terms1-Deamino-8-D-Arginine Vasopressin; Desmopressin Acetate

Desonide

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(DES oh nide)

U.S. Brand NamesDesonate™; DesOwen®; LoKara™; Verdeso™

Canadian Brand NamesDesocort®; PMS-Desonide

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsAdjunctive therapy for inflammation in acute and chronic corticosteroid responsive dermatosis (low potency corticosteroid); mild-to-moderate atopic dermatitis

Dosing: Adults

Corticosteroid responsive dermatoses: Topical: Therapy should be discontinued when control is achieved. If no improvement is seen within 2 weeks, reassessment of diagnosis may be necessary.

Cream, ointment: Apply 2-4 times/day sparingly

Lotion: Apply 2-3 times/day sparingly

Atopic dermatitis: Aerosol, gel: Apply 2 times/day sparingly. Therapy should be discontinued when control is achieved. If no improvement is seen within 4 weeks, reassessment of diagnosis may be necessary.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Corticosteroid responsive dermatoses:** Refer to adult dosing.

Atopic dermatitis: Children ≥3 months: Refer to adult dosing.

Administration: TopicalDo not use on open wounds; apply sparingly using smallest amount needed to adequately cover the affected area. Use of occlusive dressings is not recommended.

Aerosol, lotion: Shake well before use.

ContraindicationsHypersensitivity to desonide or any component of the formulation

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Chronic use of corticosteroids in children may interfere with growth and development.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic events were not observed in rats or rabbits following topical administration of the cream in doses similar to the maximum human dose, based on body surface area. Teratogenic events have been reported following systemic use of corticosteroids.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsSystemic corticosteroids are excreted in human milk. The extent of topical absorption is variable. Use with caution while breast-feeding.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, peripheral edema

Central nervous system: Asthma, cough, headache, irritability

Dermatologic: Dry skin, erythema (transient, intense), folliculitis, peeling of skin, pruritus, rash, scaly skin, telangiectasia

Endocrine & metabolic: HPA axis suppression, hyperglycemia

Genitourinary: Xerostomia

Hepatic: Liver function abnormality

Local: Application site: Atrophy, burning, dermatitis, stinging

Respiratory: Pharyngitis, upper respiratory tract infection

Miscellaneous: Infection

Reported with other topical corticosteroids, may occur more frequently with occlusive dressings: Acneiform eruptions, allergic contact dermatitis, Cushing's syndrome (children), growth retardation (children), hypopigmentation, intracranial hypertension (children), miliaria, perioral dermatitis, secondary infection, skin atrophy, striae, weight gain delayed (children)

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Patient Education

A thin film is effective; do not overuse. Rub in lightly. Do not cover or use occlusive bandaging. Do not use tight-fitting diapers or plastic pants on children being treated in the diaper area. Use only as prescribed and for no longer than the period prescribed. Avoid contact with eyes; notify prescriber if condition being treated persists or worsens. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, topical [foam]:

Verdeso®: 0.05% (50 g, 100 g)

Cream, topical: 0.05% (15 g, 60 g)

DesOwen®: 0.05% (60 g)

Gel, topical [aqueous]:

Desonate™: 0.05% (15 g [DSC], 30 g [DSC], 60 g)

Lotion, topical: 0.05% (60 mL, 120 mL)

DesOwen® [DSC], LoKara™: 0.05% (60 mL, 120 mL)

Ointment, topical: 0.05% (15 g, 60 g)

DesOwen®: 0.05% (60 g)

Mechanism of ActionStimulates the synthesis of enzymes needed to decrease inflammation, suppress mitotic activity, and cause vasoconstriction

Pharmacodynamics/Kinetics

Absorption: Extensive from scalp, face, axilla, and scrotum; adequate through epidermis on appendages; may be increased with inflammation or occlusion

Metabolism: Hepatic

Excretion: Primarily urine

Related Information

- Corticosteroids

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Medication Safety Issues

Sound-alike/look-alike issues:

Desoximetasone may be confused with dexamethasone

Topicort® may be confused with Topic®

Pronunciation(des oks i MET a sone)

U.S. Brand NamesTopicort®; Topicort®-LP

Canadian Brand NamesTaro-Desoximetasone; Topicort®

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsRelieves inflammation and pruritic symptoms of corticosteroid-responsive dermatosis (intermediate- to high-potency topical corticosteroid)

Use: DentalShort-term relief of inflammation of moderate to severe corticosteroid-responsive dermatosis (intermediate- to high-potency topical corticosteroid)

Dosing: AdultsSteroid-response dermatoses: Topical: Apply a thin film to affected area twice daily

Note: Desoximetasone is a potent fluorinated topical corticosteroid. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricSteroid-response dermatoses: Topical:

Cream, gel: Refer to adult dosing.

Ointment: Children ≥10 years: Refer to adult dosing.

Administration: TopicalFor external use only; apply sparingly to occlusive dressings; should not be used in the presence of open or weeping lesions.

ContraindicationsHypersensitivity to desoximetasone or any component of the formulation; topical fungal infections; tuberculosis of skin herpes simplex

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Safety and efficacy of desoximetasone ointment have not been established in children <10 years of age. Chronic use of corticosteroids in children may interfere with growth and development.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. However, topical desoximetasone is teratogenic in animals; use during pregnancy with caution. In general, the use of large amounts, or prolonged use, of topical corticosteroids during pregnancy should be avoided.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions<1%: Acneiform eruptions, allergic contact dermatitis, burning, dry skin, erythema, folliculitis, folliculopustular lesions, hypertrichosis, hypopigmentation, itching; local burning, irritation, miliaria; perioral dermatitis, secondary infection, skin atrophy, skin maceration, striae, vesiculation

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Patient EducationA thin film is effective; do not overuse. Rub in lightly. Do not use tight-fitting diapers or plastic pants on children being treated in the diaper area. Use only as prescribed and for no longer than the period prescribed. Avoid contact with eyes; notify prescriber if condition being treated persists or worsens. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(des ven la FAX een)

U.S. Brand NamesPristiq™

Pharmacologic CategoryAntidepressant, Serotonin/Norepinephrine Reuptake Inhibitor

Use: Labeled IndicationsTreatment of major depressive disorder

Dosing: Adults**Depression:** Oral: 50 mg once daily; up to 400 mg once daily have been studied; however, the manufacturer states there is no evidence that higher doses confer any additional benefit. A flat dose response curve for efficacy between 50-400 mg/day has been noted as well as an increase in adverse events.

Note: Gradually taper dose (by increasing dosing interval) if discontinuing.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} ≥30 mL/minute: No dosage adjustment required.

Cl_{cr} <30 mL/minute: 50 mg every other day (maximum).

Hemodialysis: 50 mg every other day (maximum). Supplemental doses not required after HD.

Dosing: Hepatic ImpairmentUsual adult dose recommended; maximum dose: 100 mg/day

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralMay be taken with or without food. Swallow tablet whole; do not crush, chew, break, or dissolve. When discontinuing therapy, extend dosing interval to taper.

Dietary ConsiderationsMay be taken with or without food.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.wyeth.com/content/showlabeling.asp?id=498.

ContraindicationsHypersensitivity to desvenlafaxine, venlafaxine or any component of the formulation; use of MAO inhibitors within 14 days; should not initiate MAO inhibitor within 7 days of discontinuing desvenlafaxine

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor for clinical worsening, suicidality, or unusual changes in behavior; the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants in children and teenagers should be dispensed with each prescription. **Desvenlafaxine is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Desvenlafaxine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anxiety/insomnia: May cause increase in anxiety, nervousness, and insomnia.
- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin or NSAIDs due to ulcerogenic potential. Data are inconclusive regarding extent of bleeding risk of SNRIs in combination with warfarin or other anticoagulants. Bleeding related to SNRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.
- CNS depression: Has a low potential to impair cognitive or motor performance; caution operating hazardous machinery or driving.
- Dyslipidemia: May cause significant dose-related increases in total cholesterol, LDL, and triglycerides; monitor.
- Hypertension: Dose-related increases in systolic and diastolic blood pressure have been documented. Monitor blood pressure regularly, and if sustained increases noted, consider dose reduction or discontinuation.
- Pulmonary events: Interstitial lung disease and eosinophilic pneumonia have been rarely reported with venlafaxine (the parent drug of desvenlafaxine). May present as progressive dyspnea, cough, and/or chest pain. Prompt evaluation and possible discontinuation of therapy may be necessary.
- Sexual dysfunction: May cause or exacerbate sexual dysfunction.
- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L). Age (the elderly), volume depletion and/or concurrent use of diuretics likely increases risk. Discontinue treatment in patients with symptomatic hyponatremia.

Disease-related concerns:

- Cardiovascular disease: May cause sustained increase in blood pressure or heart rate. Control pre-existing hypertension prior to initiation of desvenlafaxine. Use caution in patients with recent history of MI, unstable heart disease, or cerebrovascular disease. Hypertensive effect is dose related.
- Hepatic impairment: Use caution.
- Narrow-angle glaucoma: May cause mydriasis; use caution in patients with increased intraocular pressure or at risk of acute narrow-angle glaucoma.
- Renal impairment: Use caution; clearance is decreased and plasma concentrations are increased; dosage reduction recommended in patients with severe renal impairment or end-stage renal disease.
- Seizure disorders: Use caution in patients with a previous seizure disorder.

Concurrent drug therapy issues:

- MAO inhibitors (MAO-I): Potential for serotonin syndrome when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur. Concurrent use with MAO inhibitors is contraindicated. Do not begin desvenlafaxine within 14 days of terminating MAO-I therapy
- Proserotonergic drugs: Serotonin syndrome (eg, symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia) may occur with concomitant use of proserotonergic drugs (ie, SSRIs/SNRIs or triptans). Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.
- Weight loss agents: Agents causing weight loss or anorectic effects should be avoided.

Special populations:

- Pediatrics: Safety and efficacy have not been established.

Other warnings/precautions:

- Withdrawal syndrome: Abrupt discontinuation or dosage reduction has been associated with a wide range of reactions, including (but not limited to) dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, impaired coordination/balance, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. When discontinuing therapy, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Geriatric ConsiderationsNo dose adjustment is necessary for age alone; adjust dose for renal function in the elderly. According to desvenlafaxine's manufacturer, 5% of the 3292 patients in clinical trials were 65 years of age or older. No differences in safety or efficacy were reported between younger and older adults. The elderly are more prone to SSRI/SNRI-induced hyponatremia.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDesvenlafaxine is classified as pregnancy category C due to adverse effects observed in animal studies. Nonteratogenic effects in the newborn following SSRI/SNRI exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hyper- or hypotonia, hyper-reflexia, jitteriness, irritability, constant crying, and tremor. The long-term effects on neurobehavior have not been studied.

Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with SSRIs or SNRIs during pregnancy be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician. If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

Desvenlafaxine is the major active metabolite of venlafaxine; also refer to the venlafaxine monograph.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsDesvenlafaxine is found in human milk. The manufacturer recommends breast-feeding during therapy only if the expected benefits to the mother outweigh any potential risk to the infant.

Adverse ReactionsReported for 50-100 mg/day.

>10%:

Central nervous system: Dizziness (10% to 13%), insomnia (9% to 12%)

Gastrointestinal: Nausea (22% to 26%), xerostomia (11% to 17%), constipation (9% to 11%), diarrhea (9% to 11%)

Miscellaneous: Diaphoresis (10% to 14%)

1% to 10%:

Cardiovascular: Palpitation (≤3%), orthostatic hypotension (<2%), syncope (<2%), hypertension (dose related; ≤1% of patients taking 50-100 mg daily had sustained diastolic BP ≥90 mm Hg)

Central nervous system: Somnolence (≤9%), fatigue (7%), anxiety (3% to 5%), abnormal dreams (2% to 3%), irritability (2%), depersonalization (<2%), extrapyramidal symptoms (<2%), hypomania (<2%), seizures (<2%), concentration decreased (≤1%)

Dermatologic: Rash (1%)

Endocrine & metabolic: Libido decreased (males 4% to 5%), cholesterol (increased by ≥50 mg/dL and ≥261 mg/dL: 3% to 4%), anorgasmia (females 1%), low density lipoprotein cholesterol (increased by ≥50 mg/dL and ≥190 mg/dL: ≤1%), sexual dysfunction (males ≤1%)

Gastrointestinal: Anorexia (5% to 8%), vomiting (≤4%), weight loss (≤2%)

Genitourinary: Urinary hesitancy (≤1%)

Hepatic: Liver function tests abnormal (≤2%)

Neuromuscular & skeletal: Tremor (≤ 3%), paresthesia (≤2%), weakness (≤2%)

Ocular: Blurred vision (3% to 4%), mydriasis (2%)

Otic: Tinnitus (2%)

Renal: Proteinuria (6% to 8%)

Respiratory: Epistaxis (<2%)

Miscellaneous: Ejaculation retarded (1% to 5%), erectile dysfunction (3% to 6%), hypersensitivity reaction (<2%), ejaculation failure (≤1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Myocardial infarction, myocardial ischemia

Metabolism/Transport Effects**Substrate** of 3A4 (minor); **Inhibits** 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Agonists: Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Aspirin: Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor). This may cause serotonin syndrome. *Risk X: Avoid combination*

NSAID (Nonselective): Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS effects).

Herb/Nutraceutical: Avoid St John's wort (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersRenal function for dosing purposes; blood pressure should be regularly monitored, especially in patients with a high baseline blood pressure; lipid panel (eg, total cholesterol, LDL, triglycerides); mental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased). Intraocular pressure should be monitored in those with baseline elevations or a history of glaucoma.

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness according to rationale for therapy and adverse reactions at beginning of therapy and periodically with long-term use. Observe for clinical worsening, suicidality, or unusual behavior changes; especially during the initial few months of therapy or during dosage changes. Monitor vital signs at the beginning and periodically throughout therapy. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLipid panel

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Extended release capsules should be swallowed whole; do not crush or chew. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience excess drowsiness or insomnia, lightheadedness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); headache, nausea, vomiting, anorexia, dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, yogurt, or boiled milk may help); postural hypotension (use caution when climbing stairs or changing position from lying or sitting to standing); urinary retention (void before taking medication); or sexual dysfunction (reversible). Report persistent CNS effects (eg, insomnia, restlessness, fatigue, anxiety, abnormal thoughts, suicidal ideation, confusion, personality changes, impaired cognitive function); muscle cramping or tremors; chest pain, palpitations, rapid heartbeat, unusual bleeding or bruising, or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, extended release:

Pristiq™: 50 mg, 100 mg

Generic AvailableNo

ManufacturerWyeth Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Pristiq)

50 mg (30): $119.96

100 mg (30): $124.99

Mechanism of ActionDesvenlafaxine is a potent and selective serotonin and norepinephrine reuptake inhibitor.

Pharmacodynamics/Kinetics

Distribution: V_d: 3.4 L/kg

Protein binding: 30%

Metabolism: Hepatic via conjugation, and oxidation via CYP3A4 (minor pathway)

Bioavailability: 80%

Half-life elimination: 11 hours; prolonged in renal failure

Time to peak, serum: 7.5 hours

Excretion: Urine (45% as unchanged drug; ~24% as metabolites)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsPart of the mechanism of desvenlafaxine is to block reuptake of norepinephrine along with dopamine. Because of the potential for norepinephrine elevation within CNS synapses, it is suggested that vasoconstrictor be administered with caution and to monitor vital signs in dental patients taking antidepressants that affect norepinephrine in this way. This is particularly important in patients taking desvenlafaxine, which has been noted to cause a sustained increase in blood pressure or heart rate. Dose-related increase in systolic and diastolic blood pressure have also been reported.

Mental Health CommentDesvenlafaxine is the active metabolite of venlafaxine (Effexor®). Both agents inhibit the reuptake of serotonin and norepinephrine and are referred to as serotonin/norepinephrine reuptake inhibitors (SNRIs). Both agents lack significant affinity for the muscarinic cholinergic, H_1-histaminergic, and alpha$_1$-adrenergic receptors. They also do not possess MAO inhibitory activity.

Parks et al, conducted a dose-finding study of desvenlafaxine in doses up to 750 mg and found that it was associated with less nausea than venlafaxine 150 mg extended release. Ahmed et al, conducted an open-label study in which patients were switched from venlafaxine extended release or placebo to desvenlafaxine. They found a low incidence of adverse reactions in the group switching from venlafaxine to desvenlafaxine, compared with the group switching from placebo to desvenlafaxine (nausea 4% vs 35%; $p<0.001$).

Overall, compared to venlafaxine, desvenlafaxine may be associated with an improved adverse effect profile and fewer drug-drug interactions, but head-to-head studies between these two agents are necessary to establish its place in therapy (Sproule, 2008).

Medication Safety Issues

Sound-alike/look-alike issues:

Dexamethasone may be confused with desoximetasone, dextroamphetamine

Decadron® may be confused with Percodan®

Maxidex® may be confused with Maxzide®

Pronunciation(deks a METH a sone)

U.S. Brand NamesDexamethasone Intensol™; DexPak® 10 Day TaperPak®; DexPak® TaperPak®; Maxidex®

Canadian Brand NamesApo-Dexamethasone®; Dexasone®; Diodex®; Maxidex®; PMS-Dexamethasone

Pharmacologic CategoryAnti-inflammatory Agent; Anti-inflammatory Agent, Ophthalmic; Antiemetic; Corticosteroid, Ophthalmic; Corticosteroid, Otic; Corticosteroid, Systemic

Use: Labeled Indications

Systemic: Primarily as an anti-inflammatory or immunosuppressant agent in the treatment of a variety of diseases including those of allergic, dermatologic, endocrine, hematologic, inflammatory, neoplastic, nervous system, renal, respiratory, rheumatic, and autoimmune origin; may be used in management of cerebral edema, septic shock, chronic swelling, as a diagnostic agent, diagnosis of Cushing's syndrome, antiemetic

Ophthalmic: Treatment of palpebral and bulbar conjunctivitis; corneal injury from chemical, radiation, thermal burns, or foreign body penetration

Otic: Treatment of inflammation of external auditory meatus; treatment of edema associated with infective otitis externa

Use: Unlabeled/Investigational

Dexamethasone suppression test: General indicator consistent with depression and/or suicide

Accelerate fetal lung maturation in patients with preterm labor

Use: DentalTreatment of a variety of oral diseases of allergic, inflammatory or autoimmune origin

Dosing: Adults

Anti-inflammatory:

Oral, I.M., I.V.: 0.75-9 mg/day in divided doses every 6-12 hours

Intra-articular, intralesional, or soft tissue: 0.4-6 mg/day

Extubation or airway edema: Oral, I.M., I.V.: 0.5-2 mg/kg/day in divided doses every 6 hours beginning 24 hours prior to extubation and continuing for 4-6 doses afterwards

Antiemetic:

Prophylaxis: Oral, I.V.: 10-20 mg 15-30 minutes before treatment on each treatment day

Continuous infusion regimen: Oral or I.V.: 10 mg every 12 hours on each treatment day

Mildly emetogenic therapy: Oral, I.M., I.V.: 4 mg every 4-6 hours

Delayed nausea/vomiting: Oral: 4-10 mg 1-2 times/day for 2-4 days **or**

8 mg every 12 hours for 2 days; then

4 mg every 12 hours for 2 days **or**

20 mg 1 hour before chemotherapy; then

10 mg 12 hours after chemotherapy; then

8 mg every 12 hours for 4 doses; then

4 mg every 12 hours for 4 doses

Ophthalmic anti-inflammatory:

Ophthalmic solution: Instill 1-2 drops into conjunctival sac every hour during the day and every other hour during the night; gradually reduce dose to every 3-4 hours, then to 3-4 times/day.

Ophthalmic suspension: Instill 1-2 drops into conjunctival sac up to 4-6 times per day; may use hourly in severe disease; taper prior to discontinuation.

Otic anti-inflammatory: Instill 3-4 drops 2-3 times a day; reduce dose gradually prior to discontinuation.

Multiple myeloma: Oral, I.V.: 40 mg/day, days 1 to 4, 9 to 12, and 17 to 20, repeated every 4 weeks (alone or as part of a regimen)

Cerebral edema: I.V. 10 mg stat, 4 mg I.M./I.V. (should be given as sodium phosphate) every 6 hours until response is maximized, then switch to oral regimen, then taper off if appropriate; dosage may be reduced after 24 days and gradually discontinued over 5-7 days

Dexamethasone suppression test (depression/suicide indicator) (unlabeled use): Oral: 1 mg at 11 PM, draw blood at 8 AM the following day for plasma cortisol determination

Cushing's syndrome, diagnostic: Oral: 1 mg at 11 PM, draw blood at 8 AM; greater accuracy for Cushing's syndrome may be achieved by the following:

Dexamethasone 0.5 mg by mouth every 6 hours for 48 hours (with 24-hour urine collection for 17-hydroxycorticosteroid excretion)

Differentiation of Cushing's syndrome due to ACTH excess from Cushing's due to other causes: Oral: Dexamethasone 2 mg every 6 hours for 48 hours (with 24-hour urine collection for 17-hydroxycorticosteroid excretion)

Multiple sclerosis (acute exacerbation): Oral: 30 mg/day for 1 week, followed by 4-12 mg/day for 1 month

Treatment of shock:

Addisonian crisis/shock (eg, adrenal insufficiency/responsive to steroid therapy): I.V.: 4-10 mg as a single dose, which may be repeated if necessary

Unresponsive shock (eg, unresponsive to steroid therapy): I.V.: 1-6 mg/kg as a single I.V. dose or up to 40 mg initially followed by repeat doses every 2-6 hours while shock persists

Physiological replacement: Oral, I.M., I.V. (should be given as sodium phosphate): 0.03-0.15 mg/kg/day **or** 0.6-0.75 mg/m^2/day in divided doses every 6-12 hours

Dosing: ElderlyRefer to adult dosing. Use cautiously in the elderly in the smallest possible dose.

Dosing: Pediatric

Antiemetic (prior to chemotherapy): I.V.: 10 mg/m^2 (initial dose) followed by 5 mg/m^2 every 6 hours as needed **or** 5-20 mg given 15-30 minutes before treatment

Anti-inflammatory and/or immunosuppressant: Oral, I.M., I.V.: 0.08-0.3 mg/kg/day **or** 2.5-10 mg/m^2/day in divided doses every 6-12 hours

Extubation or airway edema: Oral, I.M., I.V.: 0.5-2 mg/kg/day in divided doses every 6 hours beginning 24 hours prior to extubation and continuing for 4-6 doses afterwards

Cerebral edema: I.V.: Loading dose: 1-2 mg/kg/dose as a single dose; maintenance: 1-1.5 mg/kg/day (maximum: 16 mg/day) in divided doses every 4-6 hours, taper off over 1-6 weeks

Bacterial meningitis in infants and children >2 months: I.V.: 0.6 mg/kg/day in 4 divided doses every 6 hours for the first 4 days of antibiotic treatment; start dexamethasone at the time of the first dose of antibiotic

Physiologic replacement: Oral, I.M., I.V.: 0.03-0.15 mg/kg/day or 0.6-0.75 mg/m^2/day in divided doses every 6-12 hours

Ophthalmic inflammation: Refer to adult dosing.

Dosing: Renal ImpairmentHemodialysis or peritoneal dialysis: Supplemental dose is not necessary.

Dosing: Combination Regimens

Leukemia, acute lymphocytic:

Hyper-CVAD + Imatinib

Hyper-CVAD (Leukemia, Acute Lymphocytic)

TVTG

VAD/CVAD

Leukemia, acute myeloid: TVTG

Lymphoma, non-Hodgkin's:

DHAP

Hyper - CVAD (Lymphoma, non-Hodgkin's)

m-BACOD

Lymphoma, non-Hodgkin's (Mantle cell): Hyper-CVAD + Rituximab

Multiple myeloma:

Bortezomib-Dexamethasone

Bortezomib-Doxorubicin-Dexamethasone

Bortezomib-Doxorubicin (Liposomal)-Dexamethasone

DTPACE

Doxorubicin (Liposomal) - Vincristine - Dexamethasone

Hyper - CVAD (Multiple Myeloma)

Lenalidomide-Dexamethasone

Lenalidomide-Dexamethasone (Low Dose)

Thalidomide-Dexamethasone

VAD

Prostate cancer: Cyclophosphamide + Vincristine + Dexamethasone

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Corticosteroid Conversion

Administration: I.V.Administer as a 5-10 minute bolus; rapid injection is associated with a high incidence of perineal discomfort.
Administration: I.V. DetailpH: 7.0-8.5
Administration: OralAdminister oral formulation with meals to decrease GI upset.
Administration: TopicalTopical formulation is for external use. Do not use on open wounds.
Administration: Other

Ophthalmic: Remove soft contact lenses prior to using solutions containing benzalkonium chloride. Do not touch tip of container to eye.

Otic: Use ophthalmic solution for otic administration. Instill directly into aural canal or may pack canal with gauze saturated with solution. Keep wick moist and remove after 12-24 hours.

Dietary ConsiderationsMay be taken with meals to decrease GI upset. May need diet with increased potassium, pyridoxine, vitamin C, vitamin D, folate, calcium, and phosphorus.

Storage

Injection solution: Store at room temperature; protect from light and freezing.

Stability of injection of parenteral admixture at room temperature (25°C): 24 hours.

Stability of injection of parenteral admixture at refrigeration temperature (4°C): 2 days; protect from light and freezing.

ReconstitutionInjection should be diluted in 50-100 mL NS or D_5W.

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, amikacin, amphotericin B cholesteryl sulfate complex, amsacrine, aztreonam, cefepime, cefpirome, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, docetaxel, doxorubicin, doxorubicin liposome, etoposide phosphate, famotidine, filgrastim, fluconazole, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, heparin, heparin with hydrocortisone sodium succinate, levofloxacin, linezolid, lorazepam, melphalan, meperidine, meropenem, morphine, ondansetron, paclitaxel, piperacillin/tazobactam, potassium chloride, propofol, remifentanil, sargramostim, sodium bicarbonate, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, vinorelbine, vitamin B complex with C, zidovudine. **Incompatible:** Ciprofloxacin, idarubicin, midazolam, topotecan. **Variable (consult detailed reference):** Methotrexate.

Compatibility in syringe: Compatible: Granisetron, metoclopramide, palonosetron, ranitidine, sufentanil. **Incompatible:** Doxapram, glycopyrrolate. **Variable (consult detailed reference):** Diphenhydramine, hydromorphone, ondansetron.

Compatibility when admixed: Compatible: Aminophylline, bleomycin, cimetidine, floxacillin, furosemide, granisetron, lidocaine, meropenem, mitomycin, nafcillin, netilmicin, ondansetron, palonosetron, prochlorperazine edisylate, ranitidine, verapamil. **Incompatible:** Daunorubicin, diphenhydramine with lorazepam and metoclopramide, metaraminol, vancomycin. **Variable (consult detailed reference):** Amikacin.

ContraindicationsHypersensitivity to dexamethasone or any component of the formulation; systemic fungal infections, cerebral malaria; ophthalmic use in viral (active ocular herpes simplex), fungal, or tuberculosis diseases of the eye

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria or viral hepatitis. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment).
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Myopathy: Acute myopathy has been reported with high dose corticosteroids, usually in patients with neuromuscular transmission disorders; may involve ocular and/or respiratory muscles; monitor creatine kinase; recovery may be delayed.
- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Adrenal insufficiency: Dexamethasone does not provide adequate mineralocorticoid activity in adrenal insufficiency (may be employed as a single dose while cortisol assays are performed). The lowest possible dose should be used during treatment; discontinuation and/or dose reductions should be gradual.
- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.
- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.
- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.
- Head injury: Increased mortality was observed in patients receiving high-dose I.V. methylprednisolone. High-dose corticosteroids should not be used for the management of head injury.
- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.
- Myocardial infarction (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.
- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.
- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.
- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.
- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.
- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Elderly: Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible effective dose for the shortest duration.
- Pediatrics: May affect growth velocity; growth should be routinely monitored in pediatric patients.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw therapy with gradual tapering of dose.

Geriatric ConsiderationsBecause of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible dose, and for the shortest possible time.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed with corticosteroids in animal reproduction studies. Dexamethasone crosses the placenta; and is partially metabolized to an inactive metabolite by placental enzymes. Due to its positive effect on stimulating fetal lung maturation, the injection is often used in patients with premature labor (24-34 weeks gestation). Some studies have shown an association between first trimester systemic corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy. Women exposed to dexamethasone during pregnancy for the treatment of an autoimmune disease may contact the OTIS Autoimmune Diseases Study at 877-311-8972.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsCorticosteroids are excreted in human milk; information specific to dexamethasone has not been located.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, bradycardia, cardiac arrest, cardiomyopathy, CHF, circulatory collapse, edema, hypertension, myocardial rupture (post-MI), syncope, thromboembolism, vasculitis

Central nervous system: Depression, emotional instability, euphoria, headache, intracranial pressure increased, insomnia, malaise, mood swings, neuritis, personality changes, pseudotumor cerebri (usually following discontinuation), psychic disorders, seizure, vertigo

Dermatologic: Acne, allergic dermatitis, alopecia, angioedema, bruising, dry skin, erythema, fragile skin, hirsutism, hyper-/hypopigmentation, hypertrichosis, perianal pruritus (following I.V. injection), petechiae, rash, skin atrophy, skin test reaction impaired, striae, urticaria, wound healing impaired

Endocrine & metabolic: Adrenal suppression, carbohydrate tolerance decreased, Cushing's syndrome, diabetes mellitus, glucose intolerance decreased, growth suppression (children), hyperglycemia, hypokalemic alkalosis, menstrual irregularities, negative nitrogen balance, pituitary-adrenal axis suppression, protein catabolism, sodium retention

Gastrointestinal: Abdominal distention, appetite increased, gastrointestinal hemorrhage, gastrointestinal perforation, nausea, pancreatitis, peptic ulcer, ulcerative esophagitis, weight gain

Genitourinary: Altered (increased or decreased) spermatogenesis

Hepatic: Hepatomegaly, transaminases increased

Local: Postinjection flare (intra-articular use), thrombophlebitis

Neuromuscular & skeletal: Arthropathy, aseptic necrosis (femoral and humoral heads), fractures, muscle mass loss, myopathy (particularly in conjunction with neuromuscular disease or neuromuscular-blocking agents), neuropathy, osteoporosis, parasthesia, tendon rupture, vertebral compression fractures, weakness

Ocular: Cataracts, exophthalmos, glaucoma, intraocular pressure increased

Renal: Glucosuria

Respiratory: Pulmonary edema

Miscellaneous: Abnormal fat deposition, anaphylactoid reaction, anaphylaxis, avascular necrosis, diaphoresis, hiccups, hypersensitivity, impaired wound healing, infections, Kaposi's sarcoma, moon face, secondary malignancy

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%); may cause nausea/indigestion if taken orally on an empty stomach

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Induces** CYP2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 3A4 (strong)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Lenalidomide: Dexamethasone may enhance the thrombogenic effect of Lenalidomide. *Risk D: Consider therapy modification*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Thalidomide: Dexamethasone may enhance the dermatologic adverse effect of Thalidomide. Dexamethasone may enhance the thrombogenic effect of Thalidomide. *Risk D: Consider therapy modification*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

↑ Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Dexamethasone interferes with calcium absorption. Limit caffeine.

Herb/Nutraceutical: Avoid cat's claw, echinacea (have immunostimulant properties).

Monitoring ParametersHemoglobin, occult blood loss, serum potassium, and glucose; intraocular pressure (with use >6 weeks)
Reference RangeDexamethasone suppression test, overnight: 8 AM cortisol <6 mcg/100 mL (dexamethasone 1 mg); plasma cortisol determination should be made on the day after giving dose
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic response, and adverse effects, according to indications for therapy, dose, route, and duration of therapy. When used for long-term therapy (>10-14 days), do not discontinue abruptly; decrease dosage incrementally. With systemic administration, caution patients with diabetes to monitor glucose levels closely (corticosteroids may alter glucose levels). Teach patient proper use (according to formulation), side effects/appropriate interventions, and symptoms to report.
Monitoring: Lab TestsHemoglobin, occult blood loss, serum potassium, glucose

Dexamethasone suppression test, overnight: 8 AM cortisol <6 mg/100 mL (dexamethasone 1 mg). Plasma cortisol determination should be made on the day after giving dose.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed, do not increase dose or discontinue abruptly without consulting prescriber.

Oral: Take with or after meals. Avoid alcohol and limit intake of caffeine or stimulants. Prescriber may recommend increased dietary vitamins, minerals, or iron. If you have diabetes, monitor glucose levels closely (antidiabetic medication may need to be adjusted). Inform prescriber if you are experiencing greater-than-normal levels of stress (medication may need adjustment). You may be more susceptible to infection (avoid crowds and persons with contagious or infective conditions and do not have any vaccinations unless approved by prescriber). Some forms of this medication may cause GI upset (small frequent meals and frequent mouth care may help). Report promptly excessive nervousness or sleep disturbances; signs of infection (eg, sore throat, unhealed injuries); excessive growth of body hair or loss of skin color; vision changes; excessive or sudden weight gain (>3 lb/week); swelling of face or extremities; respiratory difficulty; muscle weakness; tarry stool, persistent abdominal pain; worsening of condition or failure to improve. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Ophthalmic: For use in eyes only. Wash hands before using. Lie down or tilt your head back and look upward. Put drops of suspension or solution inside lower eyelid. Close eye and roll eyeball in all directions. Do not blink for $^1/_2$ minute. Apply gentle pressure to inner corner of eye for 30 seconds. Do not use any other eye preparation for at least 10 minutes. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Do not share medication with anyone else. Wear sunglasses when in sunlight; you may be more sensitive to bright light. Inform prescriber if condition worsens, fails to improve, or if you experience eye pain, disturbances of vision, or other adverse eye response.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Elixir, as base: 0.5 mg/5 mL (240 mL)

Injection, solution, as sodium phosphate: 4 mg/mL (1 mL, 5 mL, 30 mL); 10 mg/mL (10 mL)

Injection, solution, as sodium phosphate [preservative free]: 10 mg/mL (1 mL)

Solution, ophthalmic, as sodium phosphate [drops]: 0.1% (5 mL)

Solution, oral: 0.5 mg/5 mL (500 mL)

Solution, oral [concentrate]:

Dexamethasone Intensol™: 1 mg/mL (30 mL) [dye free, sugar free; contains alcohol 30% and propylene glycol]

Suspension, ophthalmic [drops]:

Maxidex®: 0.1% (5 mL) [contains benzalkonium chloride]

Tablet [scored]: 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg

DexPak® 10 Day TaperPak®: 1.5 mg [35 tablets on taper dose card]

DexPak® TaperPak®: 1.5 mg [51 tablets on taper dose card]

Generic AvailableYes: Excludes ophthalmic suspension
Pricing: U.S. (www.drugstore.com)

Elixir (Dexamethasone)

0.5 mg/5 mL (120): $47.70

Solution (Dexamethasone Sodium Phosphate)

0.1% (5): $19.99

4 mg/mL (25): $41.99

Suspension (Maxidex)

0.1% (5): $45.08

0.1% (15): $86.99

Tablets (Dexamethasone)

1 mg (30): $19.99

2 mg (30): $21.99

6 mg (30): $22.99

Mechanism of ActionDecreases inflammation by suppression of neutrophil migration, decreased production of inflammatory mediators, and reversal of increased capillary permeability; suppresses normal immune response. Dexamethasone's mechanism of antiemetic activity is unknown.

Pharmacodynamics/Kinetics

Onset of action: Acetate: Prompt

Duration of metabolic effect: 72 hours; acetate is a long-acting repository preparation

Metabolism: Hepatic

Half-life elimination: Normal renal function: 1.8-3.5 hours; Biological half-life: 36-54 hours

Time to peak, serum: Oral: 1-2 hours; I.M.: ~8 hours

Excretion: Urine and feces

- Corticosteroids
- Inhalant Agents

Pharmacotherapy PearlsEffects of inhaled/intranasal steroids on growth have been observed in the absence of laboratory evidence of HPA axis suppression, suggesting that growth velocity is a more sensitive indicator of systemic corticosteroid exposure in pediatric patients than some commonly used tests of HPA axis function. The long-term effects of this reduction in growth velocity associated with orally-inhaled and intranasal corticosteroids, including the impact on final adult height, are unknown. The potential for “catch up” growth following discontinuation of treatment with inhaled corticosteroids has not been adequately studied.

Withdrawal/tapering of therapy: Corticosteroid tapering following short-term use is limited primarily by the need to control the underlying disease state; tapering may be accomplished over a period of days. Following longer-term use, tapering over weeks to months may be necessary to avoid signs and symptoms of adrenal insufficiency and to allow recovery of the HPA axis. Testing of HPA axis responsiveness may be of value in selected patients. Subtle deficits in HPA response may persist for months after discontinuation of therapy, and may require supplemental dosing during periods of acute illness or surgical stress.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia and nervousness are common; may cause euphoria, confusion, or hallucinations

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may decrease dexamethasone effects

Cardiovascular ConsiderationsLong-term steroid therapy is associated with a fluid retention and hypertension. Glucocorticoid agents have some mineralocorticoid activity with consequent hemodynamic effects. Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. In discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia.

Oral and intravenous steroid therapy in patients with heart failure should be administered cautiously with special attention given to signs and symptoms of fluid retention.

Although glucocorticoids can provide relief from pericarditis postmyocardial infarctions, these drugs may cause thinning of the developing scar and myocardial rupture. Avoid use in acute myocardial infarction; may cause wall rupture.

Anesthesia and Critical Care Concerns/Other ConsiderationsDexamethasone is a long-acting corticosteroid with minimal sodium-retaining potential.

Neuromuscular Effects: ICU-acquired paresis was recently studied in 5 ICUs (3 medical and 2 surgical ICUs) at 4 French hospitals. All ICU patients without pre-existing neuromuscular disease admitted from March 1999 through June 2000 were evaluated (De Jonghe, 2002). Each patient had to be mechanically ventilated for ≥7 days and was screened daily for awakening. The first day the patient was considered awake was Study Day 1. Patients with severe muscle weakness on Study Day 7 were considered to have ICU-acquired paresis. Among the 95 patients who were evaluable, about 25% developed ICU-acquired paresis. Independent predictors included: female gender, the number of days with ≥2 organ dysfunction, and administration of corticosteroids. Further studies may be required to verify and characterize the association between the development of ICU-acquired paresis and use of corticosteroids. Concurrent use of a corticosteroid and muscle relaxant appear to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible (De Jonghe, 2002).

Adrenal Insufficiency: Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. When discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia. Patients on long-term steroid supplementation will require higher corticosteroid doses when subject to stress (ie, trauma, surgery, severe infection). Guidelines for glucocorticoid replacement during various surgical procedures has been published (Coursin, 2002; Salem, 1994).

Head Injury: The use of high-dose corticosteroids in acute head injury has been investigated in an international, double-blind, placebo-controlled trial. The purpose of this trial was to evaluate the effect of early administration of a 48-hour infusion of methylprednisolone on the risk of death and disability after a head injury. Adults (≥16 years of age) were randomized within 8 hours of a head injury if they had a Glasgow coma score of 14 or less and had no clear indication or contraindication for corticosteroid use. Ten thousand and eight patients were randomized to either placebo or 2 g of methylprednisolone infused over 1 hour, followed by a continuous infusion of 0.4 g per hour for 48 hours. Primary outcome measures were death from any cause within 2 weeks of injury and the composite of death or disability after 6 months. Patients that received methylprednisolone had a higher relative risk of death at two weeks and at 6 months. The risk of death or disability at 6 months was higher in the methylprednisolone group but this result was not statistically significant. There were also no subsets of patients (time since injury, severity of injury) that benefited from corticosteroid treatment. The investigators concluded that corticosteroids should not be routinely used in the treatment of acute head injury (Roberts, 2004; Edwards, 2005).

Recent guidelines from the Brain Trauma Foundation for the management of severe traumatic brain injury state that steroids are not recommended for improving outcome or reducing intracranial pressure. The use of high dose methyprednisolone in patients with moderate-to-severe traumatic brain injury is associated with increased mortality and is contraindicated (Bratton, 2007).

Septic Shock: A recent randomized, double-blind, placebo controlled trial assessed whether low dose corticosteroid administration could improve 28-day survival in patients with septic shock and relative adrenal insufficiency. Relative adrenal insufficiency was defined as an inappropriate response to corticotropin administration (increase of serum cortisol of ≤9 mcg/dL from baseline). Cortisol levels were drawn immediately before corticotropin administration and 30-60 minutes afterwards. Three hundred adult septic shock patients requiring mechanical ventilation and vasopressor support were randomized to either hydrocortisone (50 mg IVP every 6 hours) and fludrocortisone (50 mcg tablet daily via nasogastric tube) or matching placebos for 7 days. In patients who did not appropriately respond to corticotropin (nonresponders), there were significantly fewer deaths in the active treatment group. Vasopressor therapy was withdrawn more frequently in this subset of the active treatment group. Adverse events were similar in both groups. Patients who lack adrenal reserve and thus have relative adrenal insufficiency during the stress of septic shock may benefit from physiologic steroid replacement. However, there was a trend for increased mortality in patients who responded to the corticotropin test (increase serum cortisol >9 mcg/dL from baseline). These patients may not benefit from physiologic steroid replacement. Further study is required to better characterize the patient populations who may benefit (Annane, 2002).

The 2008 Surviving Sepsis Campaign guidelines recommend doses of corticosteroids comparable to >300 mg hydrocortisone daily **not** be used in severe sepsis or septic shock for the purpose of treating septic shock (Grade 1A). They also recommend corticosteroids **not** be administered for the treatment of sepsis in the absence of shock. There is, however, no contraindication to continuing maintenance steroid therapy or to using stress dose steroids if the patient's endocrine or corticosteroid administration history warrants (Grade 1D).

Index TermsDexamethasone Sodium Phosphate

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsRelief of symptoms of upper respiratory mucosal congestion in seasonal and perennial nasal allergies, acute rhinitis, rhinosinusitis and eustachian tube blockage

Dosing: AdultsAllergy symptoms, rhinitis, and nasal congestion: Oral: 1 timed release tablet every 12 hours, may require 1 tablet every 8 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >12 years: Refer to adult dosing.

Administration: OralSwallow tablet whole; do not crush or chew.

Dietary ConsiderationsMay be taken with food or water.

Pregnancy Risk FactorB

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, sustained action: Dexbrompheniramine maleate 6 mg and pseudoephedrine sulfate 120 mg

Generic AvailableYes

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause drowsiness, anxiety, and nervousness

Mental Health: Effects on Psychiatric TreatmentDry mouth is common; this effect may be worsened by concurrent psychotropic use

Index TermsPseudoephedrine and Dexbrompheniramine

International Brand NamesDisofrol (ES); Drixoral (HK, ID, SG, TW); Rinafort (MY)

Dexchlorpheniramine and Pseudoephedrine

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state "Do not use in children under four years of age." In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, "Infant Deaths Associated with Cough and Cold Medications - Two States, 2005," *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Pronunciation(deks klor fen EER a meen & soo doe e FED rin)

U.S. Brand NamesAllerDur™; Duotan PD [DSC]; SuTan

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsRelief of nasal congestion associated with the common cold, hay fever, and other allergies, sinusitis, and vasomotor and allergic rhinitis

Dosing: AdultsRhinitis/decongestant: Oral:

AllerDur™: 15 mL every 12 hours (maximum: 30 mL/24 hours)

DuoTan PD: 10-20 mL every 12 hours (maximum: 40 mL/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRhinitis/decongestant: Oral: Children:

2-6 years:

AllerDur™: 2.5-5 mL every 12 hours (maximum: 10 mL/24 hours)

DuoTan PD: 2.5-5 mL every 12 hours (maximum: 10 mL/24 hours)

6-12 years:

AllerDur™: 5-7.5 mL every 12 hours (maximum: 15 mL/24 hours)

DuoTan PD: 5-10 mL every 12 hours (maximum: 20 mL/24 hours)

≥12 years: Refer to adult dosing.

Administration: OralShake suspension well prior to use.

ContraindicationsHypersensitivity to dexchlorpheniramine, pseudoephedrine, or any component of the formulation; severe hypertension; severe cardiovascular disease; use with or within 2 weeks of discontinuing MAO inhibitor; narrow-angle glaucoma; urinary retention; peptic ulcer disease; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease). Use is contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Safety and efficacy have not been established in children <2 years of age.

Geriatric ConsiderationsElderly patients should be counseled about the proper use of over-the-counter cough and cold preparations. Elderly are more predisposed to adverse effects of sympathomimetics since they frequently have cardiovascular diseases and diabetes mellitus as well as multiple drug therapies. It may be advisable to treat with a short-acting/immediate-release formulation before initiating sustained-release/long-acting formulations. Anticholinergic action may cause significant confusional symptoms, constipation, or problems voiding urine.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Refer to individual agents.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsPseudoephedrine is excreted in breast milk. The manufacturers do not recommend its use while breast-feeding; however, the AAP considers it to be “compatible” with breast-feeding. Information for dexchlorpheniramine is not available.

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsSee individual monographs for dexchlorpheniramine and pseudoephedrine.

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension:

AllerDur™: Dexchlorpheniramine tannate 3 mg and pseudoephedrine tannate 50 mg per 5 mL (480 mL) [sugar free; contains sodium benzoate; candy-apple flavor]

Duotan PD: Dexchlorpheniramine tannate 2.5 mg and pseudoephedrine tannate 75 mg per 5 mL (120 mL, 480 mL) [contains sodium benzoate; strawberry-banana flavor] [DSC]

SuTan: Dexchlorpheniramine tannate 3 mg and pseudoephedrine tannate 50 mg per 5 mL (480 mL) [candy-apple flavor]

Generic AvailableYes
Mechanism of Action

Chlorpheniramine competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract. Dexchlorpheniramine is the predominant active isomer of chlorpheniramine and is approximately twice as active as the racemic compound.

Pseudoephedrine is a sympathomimetic amine and isomer of ephedrine; acts as a decongestant in respiratory tract mucous membranes with less vasoconstrictor action than ephedrine in normotensive individuals.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation)
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusSedation is common; may cause nervousness, depression, or confusion
Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment. Concomitant use with psychotropics may produce additive sedation.
Index TermsPseudoephedrine Tannate and Dexchlorpheniramine Tannate

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Geriatric ConsiderationsAnticholinergic action may cause significant confusional symptoms, constipation, or problems voiding urine.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Slight to moderate drowsiness

Respiratory: Thickening of bronchial secretions

1% to 10%:

Central nervous system: Headache, fatigue, nervousness, dizziness

Gastrointestinal: Appetite increase, weight gain, nausea, diarrhea, abdominal pain, xerostomia

Neuromuscular & skeletal: Arthralgia

Respiratory: Pharyngitis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake as directed; do not exceed recommended dose. Do not chew or crush sustained release tablet. Take with food or water. Avoid use of other depressants, alcohol, or sleep-inducing medications unless approved by prescriber. You may experience drowsiness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth, nausea, or abdominal pain (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report persistent sedation, confusion, or agitation; changes in urinary pattern; blurred vision; sore throat, respiratory difficulty or expectorating (thick secretions); or lack of improvement or worsening or condition. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Syrup, as maleate: 2 mg/5 mL (480 mL) [contains alcohol 6%; orange flavor]

Tablet, sustained action, as maleate: 4 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Syrup (Dexchlorpheniramine Maleate)

2 mg/5 mL (120): $20.99

Mechanism of ActionCompetes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract. Dexchlorpheniramine is the predominant active isomer of chlorpheniramine and is approximately twice as active as the racemic compound.

Pharmacodynamics/Kinetics

Onset of action: ~1 hour

Duration: 3-6 hours

Absorption: Well absorbed

Metabolism: Hepatic

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause nervousness and depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may cause additive sedation

Index TermsDexchlorpheniramine Maleate

Medication Safety Issues

Sound-alike/look-alike issues:

Precedex® may be confused with Peridex®

Pronunciation(deks MED e toe mi deen)
U.S. Brand NamesPrecedex®
Canadian Brand NamesPrecedex®
Pharmacologic CategoryAlpha$_2$-Adrenergic Agonist; Sedative
Use: Labeled IndicationsSedation of initially intubated and mechanically ventilated patients during treatment in an intensive care setting; sedation prior to and/or during surgical or other procedures of nonintubated patients; duration of infusion should not exceed 24 hours
Use: Unlabeled/InvestigationalUnlabeled uses include premedication prior to anesthesia induction with thiopental; relief of pain and reduction of opioid dose following laparoscopic tubal ligation; as an adjunct anesthetic in ophthalmic surgery; treatment of shivering; premedication to attenuate the cardiostimulatory and postanesthetic delirium of ketamine; use in children
Dosing: AdultsIndividualized and titrated to desired clinical effect; duration of infusion should not exceed 24 hours.

ICU sedation: I.V.: Initial: Loading infusion of 1 mcg/kg over 10 minutes, followed by a maintenance infusion of 0.2-0.7 mcg/kg/hour; adjust rate to desired level of sedation

Procedural sedation: I.V.: Initial: Loading infusion of 1 mcg/kg (or 0.5 mcg/kg for less invasive procedures [eg, ophthalmic]) over 10 minutes, followed by a maintenance infusion of 0.6 mcg/kg/hour, titrate to desired effect; usual range: 0.2-1 mcg/kg/hour

Fiberoptic intubation (awake): I.V. Initial: Loading infusion of 1 mcg/kg over 10 minutes, followed by a maintenance infusion of 0.7 mcg/kg/hour until endotracheal tube is secured.

Dosing: Elderly

ICU sedation: I.V.: Refer to adult dosing. Dosage reduction may need to be considered. No specific guidelines available. Dose selections should be cautious, at the low end of dosage range; titration should be slower, allowing adequate time to evaluate response.

Procedural sedation: I.V.: Refer to adult dosing: Initial: Loading infusion of 0.5 mcg/kg over 10 minutes; Maintenance infusion: Dosage reduction should be considered.

Dosing: Renal ImpairmentDosage reduction may need to be considered. No specific guidelines available.
Dosing: Hepatic ImpairmentDosage reduction may need to be considered. No specific guidelines available.
Administration: I.V.Administer using a controlled infusion device. Must be diluted in 0.9% sodium chloride solution to achieve the required concentration (4 mcg/mL) prior to administration. Advisable to use administration components made with synthetic or coated natural rubber gaskets. Parenteral products should be inspected visually for particulate matter and discoloration prior to administration. If loading dose used, administer over 10 minutes; may extend to 20 minutes to further reduce vasoconstrictive effects.
StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).
ReconstitutionAdd 2 mL (200 mcg) of dexmedetomidine to 48 mL of 0.9% sodium chloride for a total volume of 50 mL (4 mcg/mL). Shake gently to mix.
CompatibilityStable in D$_5$W, LR, 0.9% NS, 20% mannitol, plasma substitute

Y-site administration: Compatible: Alfentanil, amikacin, aminophylline, amiodarone, ampicillin, ampicillin and sulbactam, atracurium, atropine, azithromycin, aztreonam, bumetanide, butorphanol, calcium gluconate, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, clindamycin, dexamethasone, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etomidate, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, inamrinone, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metronidazole, midazolam, milrinone, mivacurium, morphine, nalbuphine, nitroglycerin, nitroprusside, norepinephrine, ofloxacin, ondansetron, pancuronium, phenylephrine, piperacillin, piperacillin and tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, ranitidine, rapacuronium, remifentanil, rocuronium, sodium bicarbonate, succinylcholine, sufentanil, sulfamethoxazole and trimethoprim, theophylline, thiopental, ticarcillin and clavulanate, tobramycin, vancomycin, vecuronium, verapamil. **Incompatible:** Amphotericin B, diazepam

May adsorb to certain types of natural rubber; use components made with synthetic or coated natural rubber gaskets whenever possible.

ContraindicationsThere are no contraindications listed in the manufacturer's labeling.
Allergy Considerations

- Dexmedetomidine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Transient hypertension: Has been primarily observed during loading dose administration and is associated with the initial peripheral vasoconstrictive effects of dexmedetomidine. Treatment of this is generally unnecessary; however, reduction of infusion rate may be required.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with heart block, bradycardia, severe ventricular dysfunction, hypovolemia, or chronic hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; cardiovascular adverse events (eg, bradycardia, hypotension) may be more pronounced.

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage reductions recommended.

Concurrent drug therapy issues:

- Vasodilators: Use with caution in patients receiving vasodilators or drugs which decrease heart rate.

Special populations:

- Elderly: Use with caution in the elderly; cardiovascular events (eg, bradycardia, hypotension) may be more pronounced. Dose reduction may be necessary.

Other warnings/precautions:

- Arousability: Patients may be arousable and alert when stimulated. This alone should not be considered as lack of efficacy in the absence of other clinical signs/symptoms.

- Experienced personnel: Should be administered only by persons skilled in management of patients in intensive care setting or operating room. Patients should be continuously monitored.

- Rapid I.V. administration: Episodes of bradycardia, hypotension, and sinus arrest have been associated with rapid I.V. administration (eg, bolus administration) or when given to patients with high vagal tone. If medical intervention is required, treatment may include stopping or decreasing the infusion; increasing the rate of I.V. fluid administration, use of pressor agents, and elevation of the lower extremities.

- Withdrawal: When withdrawn abruptly in patients who have received >24 hours, withdrawal symptoms similar to clonidine withdrawal may result (eg, hypertension, nervousness, agitation, headaches). Use for >24 hours is not recommended.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Cardiovascular: Hypotension (24% to 54%), bradycardia (5% to 14%)

Respiratory: Respiratory depression (37%)

1% to 10%:

Cardiovascular: Atrial fibrillation (4% to 5%), hypovolemia (3%)

Endocrine & metabolic: Hypocalcemia (1%)

Gastrointestinal: Nausea (3% to 9%), xerostomia (3% to 4%)

Renal: Urine output decreased (1%)

Respiratory: Pleural effusion (32%), wheezing (≤1%)

Postmarketing and/or case reports: Abdominal pain, abnormal vision, acidosis, agitation, alkaline phosphatase increased, ALT increased, anemia, apnea, arrhythmia, AST increased, atrioventricular block, BUN increased, bronchospasm, cardiac arrest, confusion, delirium, diaphoresis, diarrhea, dizziness, dyspnea, extrasystoles, fever, GGT increased, hallucination, headache, heart block, hemorrhage, hepatic impairment, hyperbilirubinemia, hypercapnia, hyperkalemia, hypertension, hypoglycemia, hypoventilation, hypoxia, illusion, MI, neuralgia, neuritis, oliguria, pain, photopsia, pulmonary congestion, respiratory acidosis, rigors, seizure, speech disorder, supraventricular tachycardia, tachycardia, thirst, T-wave inversion, ventricular arrhythmia, ventricular tachycardia, vomiting

Metabolism/Transport Effects**Substrate** of CYP2A6 (major); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2D6 (strong), 3A4 (weak)

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antidepressants (Alpha2-Antagonist): May diminish the hypotensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

CYP2A6 Inhibitors (Moderate): May decrease the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2A6 Inhibitors (Strong): May decrease the metabolism of CYP2A6 Substrates. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Iobenguane I 123: Alpha2-Agonists may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: May diminish the antihypertensive effect of Alpha2-Agonists. *Risk D: Consider therapy modification*

Monitoring ParametersLevel of sedation; heart rate, respiration, rhythm, blood pressure; pain control

Nursing: Physical Assessment/MonitoringAdministration should be managed by professionals experienced in anesthesia. Dosage and rate of administration should be individualized and titrated to the desired effect, according to relevant clinical factors, premedication, concomitant medications, age, and general condition of patient. Assess other medications for effectiveness and safety. Other drugs that cause CNS depression may increase CNS depression induced by dexmedetomidine (monitor and adjust dosage as necessary). Continuous monitoring of vital signs, cardiac and respiratory status, and level of sedation is mandatory during infusion and until full consciousness is regained. Safety precautions must be maintained until patient is fully alert. Dexmedetomidine is an anesthetic; pain must be treated with appropriate analgesic agents. Do not discontinue abruptly (may result in rapid awakening associated with anxiety, agitation, and resistance to mechanical ventilation). Titrate infusion rate so patient awakes slowly. Monitor fluid levels (intake and output) during and following infusion. Reposition patient and provide appropriate skin, mouth, and eye care every 2-3 hours, while sedated. Provide appropriate emotional and sensory support (auditory and environmental).

Patient EducationThis is an anesthetic. Patient education should be appropriate to individual situation. Following return of consciousness, do not attempt to change position or rise from bed without assistance. Report immediately any pounding or unusual heartbeat, respiratory difficulty, or acute dizziness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Precedex®: 100 mcg/mL (2 mL)

Generic AvailableNo

Mechanism of ActionSelective alpha$_2$-adrenoceptor agonist with anesthetic and sedative properties thought to be due to activation of G-proteins by apha$_{2a}$-adrenoceptors in the brainstem resulting in inhibition of norepinephrine release; peripheral alpha$_{2b}$-adrenoceptors are activated at high doses or with rapid I.V. administration resulting in vasoconstriction.

Pharmacodynamics/Kinetics

Onset of action: Rapid

Distribution: V$_{ss}$: ~118 L; rapid

Protein binding: ~94%

Metabolism: Hepatic via N-glucuronidation, N-methylation, and CYP2A6

Half-life elimination: ~6 minutes; Terminal: ~2 hours

Excretion: Urine (95%); feces (4%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common

Mental Health: Effects on Psychiatric TreatmentHypotension and sedation are common; concurrent use with psychotropics may produce additive hypotension and sedation; monitor

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Dexmedetomidine causes minimal respiratory depression, inhibits salivation, and is analgesic-sparing. Assess the patient for pain during infusion; the sedation produced by this agent is not equivalent to analgesia. Adequate pain management should be addressed. Dexmedetomidine does not provide adequate and reliable amnesia; therefore, use of additional agents with amnestic properties may be necessary.

Hemodynamic effects: Dexmedetomidine is associated with hypotension and bradycardia due to inhibition of norepinephrine release from presynaptic neurons. Hypertension due to stimulation of peripheral vascular alpha$_{2b}$-adrenoceptors may also occur with rapid I.V. administration or high-dose infusion rates. In addition, rapid I.V. administration may also induce bradycardia. The loading infusion may be administered over a longer period of time (eg, 20-30 minutes) or may be omitted. Initiation of a maintenance infusion without administration of the loading infusion achieves similar levels of sedation without the undesirable hemodynamic effects (Ickeringill, 2004).

At low concentrations, mean arterial pressure (MAP) may be reduced without changes in other hemodynamic parameters (eg, pulmonary artery occlusion pressure [PAOP]); however, at higher concentrations (>1.9 ng/mL), MAP, CVP, PAOP, PVR, and SVR increase. An infusion rate of 0.7 mcg/kg/hour, the higher end of the manufacturer recommended dosing range, results in plasma concentrations of ~1.25 ng/mL.

Infusion duration: Infusion durations >24 hours are not recommended by the manufacturer due to the potential for the development of withdrawal symptoms (eg, hypertension, agitation). However,a study conducted in 20 critically ill patients with a mean APACHE II score of 23 (±9) demonstrated that although patients received prolonged infusions (median: 71.5 hours; range: 35-168 hours), dexmedetomidine did not produce cardiovascular rebound upon abrupt discontinuation. However, SBP and HR did increase by 7% and 11%, respectively. Patients were monitored for 24 hours after discontinuation (Shehabi, 2004).

Evidence-Based Information: In a prospective, observational study of 12 ventilator-dependent patients, dexmedetomidine was assessed as a sedative. Patients received a loading dose infusion of 1 mcg/kg over 10 minutes followed by the manufacturer's recommended infusion rate (0.2-0.7 mcg/kg/hour) for up to 7 days. Some patients required higher maintenance infusion rates than recommended by the manufacturer. Mean infusion rate was 1 ± 0.7 mcg/kg/hour. The maximum rate was 2.5 mcg/kg/hour. Adverse cardiovascular events were most frequently related to the initial loading infusion. These investigators suggest using a lower loading infusion. Higher maintenance infusions may be required in some patients. Patients did not experience a withdrawal syndrome when the infusion was discontinued (Venn, 2003).

Special Alerts

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children's Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

Dexmethylphenidate may be confused with methadone

Pronunciation(dex meth il FEN i date)
U.S. Brand NamesFocalin®; Focalin® XR
Pharmacologic CategoryCentral Nervous System Stimulant
Use: Labeled IndicationsTreatment of attention-deficit/hyperactivity disorder (ADHD)
Dosing: Adults

Treatment of ADHD: Patients not currently taking methylphenidate: Oral:

Tablet: Initial: 2.5 mg twice daily; dosage may be adjusted in increments of 2.5-5 mg at weekly intervals (maximum dose: 20 mg/day); doses should be taken at least 4 hours apart

Capsule: Initial: 10 mg/day; dosage may be adjusted in increments of 10 mg/day at weekly intervals (maximum dose: 20 mg/day)

Note:

Conversion to dexmethylphenidate from methylphenidate: Tablet, capsule: Initial: Half the total daily dose of racemic methylphenidate (maximum dexmethylphenidate dose: 20 mg/day)

Conversion from dexmethylphenidate immediate release to dexmethylphenidate extended release: When changing from Focalin® tablets to Focalin® XR capsules, patients may be switched to the same daily dose using Focalin® XR (maximum dose: 20 mg/day)

Dose reductions and discontinuation: Reduce dose or discontinue in patients with paradoxical aggravation of symptoms. Discontinue if no improvement is seen after 1 month of treatment.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Treatment of ADHD:**
Children ≥6 years: Patients not currently taking methylphenidate: Oral:

Tablet: Initial: 2.5 mg twice daily; dosage may be adjusted in increments of 2.5-5 mg at weekly intervals (maximum dose: 20 mg/day); doses should be taken at least 4 hours apart

Capsule: Initial: 5 mg/day; dosage may be adjusted in increments of 5 mg/day at weekly intervals (maximum dose: 20 mg/day)

See "Note" in adult dosing.

Dosing: Renal ImpairmentNo data available. However, considering extensive metabolism to inactive compounds, renal insufficiency expected to have minimal effect on kinetics of dexmethylphenidate.
Dosing: Hepatic ImpairmentNo data available.
Administration: Oral

Capsule: Should be administered once daily in the morning; do not crush or chew. Capsules may be opened and contents sprinkled over a spoonful of applesauce; consume immediately; do not store for future use.

Tablet: Should be administered at least 4 hours apart; may be taken with or without food.

Dietary ConsiderationsMay be taken with or without food. Food effects on Focalin® XR have not been studied and may need to be individually adjusted.
StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light and moisture.
RestrictionsC-II

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to dexmethylphenidate, methylphenidate, or any component of the formulation; marked anxiety, tension, and agitation; glaucoma, motor tics, family history or diagnosis of Tourette's syndrome; use with or within 14 days following MAO inhibitor therapy
Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Boxed warnings:

- Drug abuse: See "Disease-related concerns" below.

Concerns related to adverse effects:

- Cardiovascular events: CNS stimulant use has been associated with serious cardiovascular events including sudden death in patients with pre-existing structural cardiac abnormalities or other serious heart problems (sudden death in children and adolescents; sudden death, stroke, and MI in adults). These products should be avoided in patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry. Patients should be carefully evaluated for cardiac disease prior to initiation of therapy.

- Visual disturbance: Difficulty in accommodation and blurred vision has been reported with the use of stimulants.

Disease-related concerns:

- ADHD treatment: Appropriate use: Recommended to be used as part of a comprehensive treatment program for attention deficit disorders.

- Drug abuse: **[U.S. Boxed Warning]: Potential for drug dependency exists; avoid abrupt discontinuation in patients who have received for prolonged periods.** Use caution in patients with history of ethanol or drug abuse.

- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate.

- Psychiatric disorders: Use with caution in patients with pre-existing psychosis or bipolar disorder (may induce mixed/manic episode). May exacerbate symptoms of behavior and thought disorder in psychotic patients; new onset psychosis or mania may occur with stimulant use; observe for symptoms of aggression and/or hostility.

- Seizure disorder: Use with caution in patients with a history of seizure disorder; may lower seizure threshold leading to new onset or breakthrough seizure activity.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age. Use of stimulants has been associated with suppression of growth; monitor growth rate during treatment.

Other warnings/precautions:

- Long-term use: Safety and efficacy of long-term use of methylphenidate have not yet been established.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were noted in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if the potential benefit to the mother outweighs the possible risks to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (25% to 26%), restlessness (12%)

Gastrointestinal: Appetite decreased (30%), abdominal pain (15%)

1% to 10%:

Cardiovascular: Tachycardia (3%)

Central nervous system: Dizziness (6%), anxiety (5% to 6%), fever (5%)

Gastrointestinal: Nausea (9%), dyspepsia (5% to 8%), xerostomia (7%), anorexia (6%), pharyngolaryngeal pain (4%)

Frequency not defined: Ocular: Accommodation difficulties, blurred vision

Also refer to Methylphenidate for adverse effects seen with other methylphenidate products.

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Phenytoin: Dexmethylphenidate may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Dexmethylphenidate may decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause CNS depression).

Food: High-fat meal may increase time to peak concentration.

Herb/Nutraceutical: Avoid ephedra (may cause hypertension or arrhythmias) and yohimbe (also has CNS stimulatory activity).

Monitoring ParametersBlood pressure and heart rate (especially in hypertensive patients), CBC with differential, platelet count; growth in children. Patients should be re-evaluated at appropriate intervals to assess continued need of the medication. Observe for signs/symptoms of aggression or hostility, or depression.

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008).

Nursing: Physical Assessment/MonitoringThis drug should be used as part of a comprehensive treatment program for ADHD. Monitor closely any other medication patient may be taking for effectiveness and possible interactions prior to beginning therapy. Perform careful cardiovascular assessment prior to initiating therapy. In children, monitor growth pattern. If growth/weight gain is not as expected, may need to discontinue medication. Assess results of laboratory tests for effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage when discontinuing from long-term therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and importance of reporting adverse symptoms promptly.

Monitoring: Lab TestsCBC with differential, ECG, platelet count

Patient EducationTake exactly as directed; do not change dosage or discontinue without consulting prescriber. Response may take some time. Avoid alcohol, caffeine, or other stimulants. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience decreased appetite or weight loss (small frequent meals may help maintain adequate nutrition); or restlessness, impaired judgment, or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Report unresolved rapid heartbeat; seizures; blurred vision; excessive agitation, nervousness, insomnia, tremors, or dizziness; blackened stool; skin rash or irritation; or altered gait or movement. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release:

Focalin® XR: 5 mg, 10 mg, 15 mg, 20 mg [bimodal release]

Tablet, as hydrochloride: 2.5 mg, 5 mg, 10 mg

Focalin®: 2.5 mg, 5 mg; 10 mg [dye free]

Generic AvailableYes: Tablet

ManufacturerMikart, Inc for Novartis Pharmaceuticals Corporation

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Focalin XR)

5 mg (20): $79.86

10 mg (20): $82.05

20 mg (20): $87.91

Tablets (Dexmethylphenidate HCl)

2.5 mg (30): $21.99

Tablets (Focalin)

5 mg (20): $26.99

10 mg (20): $34.55

Mechanism of ActionDexmethylphenidate is the more active, *d-threo*-enantiomer, of racemic methylphenidate. It is a CNS stimulant; blocks the reuptake of norepinephrine and dopamine, and increases their release into the extraneuronal space.

Pharmacodynamics/Kinetics

Duration of action: Capsule: 12 hours

Absorption: Tablet: Rapid; Capsule: Bimodal

Distribution: V_d: 1.54-3.76 L/kg

Protein binding: 12% to 15%

Metabolism: Via de-esterification to inactive metabolite, *d*-α-phenyl-piperidine acetate (*d*-ritalinic acid)

Bioavailability: 22% to 25%

Half-life elimination: Immediate release: Adults: 2-4.5 hours; Children: 2-3 hours

Time to peak: Fasting:

Tablet: 1-1.5 hours

Capsule: First peak: 1.5 hours (range: 1-4 hours); Second peak: 6.5 hours (range: 4.5-7 hours)

Excretion: Urine (90%, primarily as inactive metabolite)

Related Information

- Methylphenidate
- Stimulant Agents Used for ADHD

Pharmacotherapy PearlsFocalin® XR capsules use a bimodal release where $^1/_2$ the dose is provided in immediate release beads and $^1/_2$ the dose is in delayed release beads. A single, once-daily dose of a capsule provides the same amount of dexmethylphenidate as two tablets given 4 hours apart.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Jump To Field (Select Field Name)

Pronunciation(deks PAN the nole)

Pharmacologic CategoryGastrointestinal Agent, Stimulant; Topical Skin Product

Use: Labeled IndicationsProphylactic use to minimize paralytic ileus; treatment of postoperative distention; topical to relieve itching and to aid healing of minor dermatoses

Dosing: Adults

Prevention of postoperative ileus: I.M.: 250-500 mg stat, repeat in 2 hours, followed by doses every 6 hours until danger passes

Paralytic ileus: I.M.: 500 mg stat, repeat in 2 hours, followed by doses every 6 hours, if needed

Dosing: ElderlyRefer to adult dosing.

Administration: I.M.Usual route of administration is I.M.

Administration: I.V.If I.V. administration is needed, may be added to a large volume of D_5W or lactated Ringer's and infused slowly.

StorageInjection: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from freezing.

ReconstitutionInjection may be diluted with D_5W or lactated Ringer's if I.V. administration is needed.

ContraindicationsHypersensitivity to dexpanthenol or any component of the formulation; mechanical obstruction of ileus

Warnings/Precautions

Other warnings/precautions:

- Appropriate use: Treatment of adynamic ileus should include correction of fluid and electrolyte imbalance, anemia, hypoproteinemia, infection and the avoidance of drugs which decrease motility.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women; use only if possible benefit outweighs potential risk to the fetus

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Slight drop in blood pressure

Central nervous system: Agitation

Dermatologic: Dermatitis, irritation, itching, urticaria

Gastrointestinal: Diarrhea, hyperperistalsis, vomiting

Neuromuscular & skeletal: Paresthesia

Respiratory: Dyspnea

Miscellaneous: Allergic reactions

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 250 mg/mL (2 mL)

Generic AvailableYes

Mechanism of ActionA pantothenic acid B vitamin analog that is converted to coenzyme A internally; coenzyme A is essential to normal fatty acid synthesis, amino acid synthesis and acetylation of choline in the production of the neurotransmitter, acetylcholine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Zinecard® may be confused with Gemzar®

Pronunciation(deks ray ZOKS ane)

U.S. Brand NamesTotect™; Zinecard®

Canadian Brand NamesZinecard®

Pharmacologic CategoryAntidote; Cardioprotectant

Use: Labeled Indications

Zinecard®: Reduction of the incidence and severity of cardiomyopathy associated with doxorubicin administration in women with metastatic breast cancer who have received a cumulative doxorubicin dose of 300 mg/m^2 and who would benefit from continuing therapy with doxorubicin. (Not recommended for use with initial doxorubicin therapy.)

Totect™: Treatment of anthracycline-induced extravasation.

Use: Unlabeled/InvestigationalReduction of the incidence and severity of cardiomyopathy associated with doxorubicin administration (cumulative doses >300 mg/m^2) in patients with malignancies other than metastatic breast cancer who would benefit from continuing therapy with doxorubicin; reduction of the incidence and severity of cardiomyopathy associated with continued epirubicin administration for advanced breast cancer

Dosing: Adults

Prevention of doxorubicin cardiomyopathy: I.V.: A 10:1 ratio of dexrazoxane:doxorubicin (500 mg/m^2 dexrazoxane: 50 mg/m^2 doxorubicin). Note: Cardiac monitoring should continue during dexrazoxane therapy; doxorubicin/dexrazoxane should be discontinued in patients who develop a decline in LVEF or clinical CHF.

Treatment of anthracycline extravasation: 1000 mg/m^2 on days 1 and 2 (maximum dose: 2000 mg), followed by 500 mg/m^2 on day 3 (maximum dose: 1000 mg); begin treatment as soon as possible, within 6 hours of extravasation

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentModerate-to-severe (Cl_{cr}<40 mL/minute):

Prevention of cardiomyopathy: Reduce dose by 50%, using a 5:1 ratio (250 mg/m^2 dexrazoxane: 50 mg/m^2 doxorubicin)

Anthracycline-induced extravasation: Reduce dose by 50%

Dosing: Hepatic ImpairmentSince doxorubicin dosage is reduced in hyperbilirubinemia, a proportional reduction in dexrazoxane dosage is recommended (maintain ratio of 10:1).

Calculations

- Body Surface Area: Adults
- Creatinine Clearance: Adults

Administration: I.V.

Prevention of doxorubicin cardiomyopathy: Administer by slow I.V. push or rapid (5-15 minutes) I.V. infusion. Administer doxorubicin within 30 minutes after beginning the infusion with dexrazoxane.

Treatment of anthracycline extravasation: Administer over 1-2 hours; begin infusion as soon as possible, within 6 hours of extravasation. Infuse in a large vein in an area remote from the extravasation. If extravasation is also being managed with cooling, withhold cooling beginning 15 minutes before dexrazoxane infusion; continue withholding cooling until 15 minutes after infusion is completed. Day 2 and 3 doses should be administered at approximately the same time (±3 hours) as the dose on day 1. For I.V. administration; **not** for local infiltration into extravasation

StorageStore intact vials at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light. According to the manufacturers, infusion solutions diluted in 1000 mL NS (Totect™) are stable for 4 hours when stored at temperatures <25°C (<77°F); solutions diluted in D_5W or NS (Zinecard®) are stable for 6 hours at room temperature of 15°C to 30°C (59°F to 86°F) or under refrigeration at 2°C to 8°C (36°F to 46°F). When studied as a 24-hour continuous infusion for the prevention of cardiomyopathy, solutions diluted to a final concentration of 0.1 or 0.5 mg/mL in D_5W were found to retain ≥90% of their initial concentration when stored at room temperature (ambient light conditions) for ≤24 hours (Tetef, 2007).

ReconstitutionMust be reconstituted with 0.167 Molar (M/6) sodium lactate injection to a concentration of 10 mg dexrazoxane/mL sodium lactate. Reconstituted dexrazoxane solution may be diluted with either 0.9% sodium chloride injection or 5% dextrose injection to a final concentration of 1.3-5 mg/mL in intravenous infusion bags for prevention of cardiomyopathy. For anthracycline-induced extravasation, add the reconstituted solution to 1000 mL NS. Use appropriate precautions for handling and disposal.

CompatibilityStable in NS, D_5W.

Y-site administration: Compatible: Gemcitabine, pemetrexed.

ContraindicationsHypersensitivity to dexrazoxane or any component of the formulation; use with chemotherapy regimens that do not contain an anthracycline

Allergy Considerations

- Dexrazoxane Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: May cause mild myelosuppression activity; myelosuppression may be additive with concurrently administered chemotherapeutic agents.
- Cardioprotection: Does not eliminate the potential for anthracycline-induced cardiac toxicity; carefully monitor cardiac function.

Disease-related concerns:

- Hepatic impairment: Due to dosage adjustments for doxorubicin in hepatic impairment, a proportional dose reduction in dexrazoxane is recommended to maintain the dosage ratio of 10:1.
- Renal impairment: Use with caution in patients with renal dysfunction; dosage adjustment required for Cl_{cr} <40 mL/minute.

Concurrent drug therapy issues:

- Dimethylsulfoxide (DMSO): Do not use DMSO in patients receiving dexrazoxane for anthracycline-induced extravasation; may diminish dexrazoxane efficacy.
- Tumor response: Dexrazoxane may interfere with the antitumor effect of chemotherapy when given concurrently with fluorouracil, doxorubicin, and cyclophosphamide (FAC).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Administration: For I.V. administration; **not** for local infiltration into extravasation site.
- Administration sequence: When used for the prevention of cardiomyopathy, doxorubicin should be administered 30 minutes after the beginning of the dexrazoxane infusion.

Pregnancy Risk FactorC (Zinecard®) / D (Totect™)

Pregnancy ConsiderationsEmbryotoxicity and teratogenicity were observed in animal studies; maternal toxicity was also noted. There are no adequate and well-controlled studies in pregnant women. Avoid use in pregnant women unless the potential benefit justifies the potential risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, discontinue nursing during dexrazoxane therapy.

Adverse Reactions Adverse reactions listed are those which were greater in the dexrazoxane arm in a trial comparison of dexrazoxane plus fluorouracil, doxorubicin, and cyclophosphamide (FAC) to FAC alone for the prevention of cardiomyopathy. Most adverse reactions are thought to be attributed to chemotherapy, except for increased myelosuppression, pain at injection site, and phlebitis.

Central nervous system: Fatigue/malaise, fever

Dermatologic: Alopecia, streaking/erythema

Endocrine & metabolic: Serum amylase increased, serum calcium decreased, serum triglycerides increased

Hematologic: Anemia, granulocytopenia, hemorrhage, leukopenia, myelosuppression, thrombocytopenia

Hepatic: ALT increased, AST increased, bilirubin increased

Local: Injection site pain (12% to 16%), phlebitis (6% to 8%), extravasation,

Neuromuscular & skeletal: Neurotoxicity

Miscellaneous: Infection, sepsis

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersSince dexrazoxane will always be used with cytotoxic drugs, and since it may add to the myelosuppressive effects of cytotoxic drugs, frequent complete blood counts are recommended; liver function; serum creatinine; cardiac function (repeat monitoring at 400 mg/m^2, 500 mg/m^2 and with every 50 mg/m^2 of doxorubicin thereafter); monitor site of extravasation

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor cardiac function closely. Assess infusion site frequently. Avoid extravasation. Monitor for effectiveness of therapy and adverse effects.

Monitoring: Lab TestsFrequent complete blood counts are recommended; liver function; serum creatinine

Patient EducationThis I.V. medication is given to reduce incidence of cardiac complications with doxorubicin. Report promptly any pain at infusion site. You will be more susceptible to infections. Avoid crowds and exposure to infections whenever possible. Report shortness of breath, chest discomfort, unusual bleeding, fever, or swelling of extremities. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 250 mg, 500 mg

Totect™: 500 mg [provided with 0.167 Molar sodium lactate injection, USP]

Zinecard®: 250 mg, 500 mg [provided with 0.167 Molar sodium lactate injection, USP]

Generic AvailableYes

Mechanism of ActionDerivative of EDTA; potent intracellular chelating agent. The mechanism of cardioprotectant activity is not fully understood. Appears to be converted intracellularly to a ring-opened chelating agent that interferes with iron-mediated oxygen free radical generation thought to be responsible, in part, for anthracycline-induced cardiomyopathy. In the management of anthracycline-induced extravasation, dexrazoxane may act by reversibly inhibiting topoisomerase II, protecting tissue from anthracycline cytotoxicity, thereby decreasing tissue damage.

Pharmacodynamics/Kinetics

Distribution: V_d: 22 L/m^2

Protein binding: None

Half-life elimination: 2-2.5 hours

Excretion: Urine (42%)

Clearance, renal: 3.35 L/hour/m^2; Plasma: 6.25-7.88 L/hour/m^2

Related Information

- Management of Drug Extravasations
- Safe Handling of Hazardous Drugs

Pharmacotherapy Pearls**Oncology Comment:** Guidelines from the American Society of Clinical Oncology (ASCO) for the use of chemotherapy and radiotherapy protectants (Schuchter, 2002; Hensley, 2008 [update]) recommend the use of dexrazoxane as a cardioprotectant in patients with metastatic breast cancer who may benefit from further doxorubicin-based chemotherapy after a cumulative doxorubicin dose >300 mg/m^2 has been reached. In patients with metastatic breast cancer who had previously received >300 mg/m^2 doxorubicin in the adjuvant setting, the decision to use dexrazoxane should be individualized, weighing the benefits of cardioprotection against the possibility of decreased response rates (due to dexrazoxane). Dexrazoxane use is not recommended in patients with metastatic breast cancer receiving doxorubicin as initial therapy. In the adjuvant setting, dexrazoxane use is not recommended outside of a clinical trial. Dexrazoxane may be considered for reduction of the incidence and severity of cardiomyopathy associated with continued epirubicin administration in patients with advanced breast cancer. In adults with malignancies other than breast cancer, dexrazoxane may be considered in patients who have received >300 mg/m^2 of doxorubicin-based therapy. Cardiac monitoring should continue during dexrazoxane therapy; discontinue doxorubicin/dexrazoxane in patients who develop a decline in LVEF or clinical CHF.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause granulocytopenia; use caution with clozapine or carbamazepine

Medication Safety Issues

Sound-alike/look-alike issues:

Dextran may be confused with Dexatrim®, Dexedrine®

Pronunciation(DEKS tran won)
U.S. Brand NamesPromit® [DSC]
Pharmacologic CategoryPlasma Volume Expander
Use: Labeled IndicationsProphylaxis of serious anaphylactic reactions to I.V. infusion of dextran
Dosing: AdultsProphylaxis of severe reactions to dextran infusions: I.V.: 20 mL 1-2 minutes before infusion of dextran. Administer 1 dose only prior to dextran. Give 1-2 minutes before I.V. infusion of dextran. Time between dextran 1 and dextran solution should not exceed 15 minutes.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricProphylaxis of severe adverse reactions to dextran: I.V. (time between dextran 1 and dextran solution should not exceed 15 minutes): Children: 0.3 mL/kg 1-2 minutes before I.V. infusion of dextran
Administration: I.V.Infuse over 1 minute.
StorageProtect from freezing.
CompatibilityDo not dilute or admix with dextrans.
ContraindicationsHypersensitivity to dextrans or any component of the formulation; **dextran** contraindicated
Allergy Considerations

- Dextran Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Mild dextran-induced anaphylactic reactions are not prevented.

- Cardiovascular effects: Severe hypotension and bradycardia can occur. If any reaction occurs, do not administer dextran.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse Reactions<1% (Limited to important or life-threatening): Mild hypotension, tightness of chest, wheezing
Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringDextran 1 is to be infused not more than 15 minutes before dextran for prophylaxis of serious anaphylactic reactions to dextran infusions. Patient should be monitored closely during infusion; hypotension and bradycardia may occur. If reaction occurs, dextran should not be given. Patient teaching should be appropriate to patient condition.
Patient EducationSince this medication is generally administered in emergency situations, patient education should be supportive and appropriate to patient condition.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution:

Promit®: 150 mg/mL (20 mL) [DSC]

Generic AvailableNo
Mechanism of ActionBinds to dextran-reactive immunoglobulin without bridge formation and no formation of large immune complexes
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular ConsiderationsDextran use in patients with restrictive cardiovascular disease or renal and hepatic impairment should be used with extreme caution. Dextran can also result in an anaphylactoid reaction. Patients should be observed closely during the first several minutes of the infusion in case anaphylactoid reaction occurs.

Medication Safety Issues

Sound-alike/look-alike issues:

Dextran may be confused with Dexatrim®, Dexedrine®

Pronunciation(DEKS tran)

U.S. Brand NamesGentran®; LMD®

Canadian Brand NamesGentran®

Pharmacologic CategoryPlasma Volume Expander

Use: Labeled IndicationsBlood volume expander used in treatment of shock or impending shock when blood or blood products are not available; dextran 40 is also used as a priming fluid in cardiopulmonary bypass and for prophylaxis of venous thrombosis and pulmonary embolism in surgical procedures associated with a high risk of thromboembolic complications

Dosing: Adults

Volume expansion/shock:

Dextran 40: 500-1000 mL at a rate of 20-40 mL/minute (maximum: 20 mL/kg/day for first 24 hours); 10 mL/kg/day thereafter; therapy should not be continued beyond 5 days

Dextran 70: 500-1000 mL at a rate of 20-40 mL/minute (maximum: 20 mL/kg/day for first 24 hours)

Pump prime:*Dextran 40:* Varies with the volume of the pump oxygenator; generally, the 10% solution is added in a dose of 1-2 g/kg

Prophylaxis of venous thrombosis/pulmonary embolism:*Dextran 40:* Begin during surgical procedure and give 50-100 g on the day of surgery; an additional 50 g (500 mL) should be administered every 2-3 days during the period of risk (up to 2 weeks postoperatively); usual maximum infusion rate for nonemergency use: 4 mL/minute

Dosing: ElderlyUse with extreme caution in patients with renal or hepatic impairment.

Dosing: PediatricTreatment of shock or impending shock (when blood or blood products are not available): I.V. (requires an infusion pump): *Dextran 40 or 70:* Total dose should not be >20 mL/kg during first 24 hours

Dosing: Renal ImpairmentUse with extreme caution.

Dosing: Hepatic ImpairmentUse with extreme caution.

Administration: I.V.For I.V. infusion only (use an infusion pump). Infuse initial 500 mL at a rate of 20-40 mL/minute if hypervolemic. Reduce rate for additional infusion to 4 mL/minute. **Observe patients closely for anaphylactic reaction.**

Administration: I.V. DetailHave other means of maintaining circulation with epinephrine and diphenhydramine available should dextran therapy result in an anaphylactoid reaction.

pH: 3-7 (dextran 40 10% in dextrose 5%); 3.5-7 (dextran 40 10% in sodium chloride)

StorageStore at room temperature. Discard partially used containers.

Compatibility

Dextran 40: Stable in D_5W, NS.

Y-site administration: Compatible: Enalaprilat, famotidine.

Compatibility when admixed: Incompatible: Amoxicillin.

Do not add any drugs to dextran solution. To prevent coagulation of blood, flush tubing well or change I.V. tubing before infusing blood after dextran.

ContraindicationsHypersensitivity to dextran or any component of the formulation; marked hemostatic defects (thrombocytopenia, hypofibrinogenemia) of all types including those caused by drugs; marked cardiac decompensation; renal disease with severe oliguria or anuria

Allergy Considerations

- Dextran Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Decreased hematocrit: Exercise care to prevent a depression of hematocrit <30% (can cause hemodilution); observe for signs of bleeding.

- Fluid overload: Administration can cause fluid overload; use with caution in patients with hypovolemia.

- Hypersensitivity reactions: Have been reported (dextran 40 rarely causes a reaction), usually early in the infusion. Monitor closely during infusion initiation for signs or symptoms of a hypersensitivity reaction. Dextran 1 is indicated for prophylaxis of serious anaphylactic reactions to dextran infusions.

- Renal failure: Has been reported; fluid status including urine output should be monitored closely.

Disease-related concerns:

- Hemorrhage: Use with caution in patients with active hemorrhage.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse Reactions<1% (Limited to important or life-threatening): Mild hypotension, tightness of chest, wheezing
Drug Interactions

Abciximab: Dextran may enhance the anticoagulant effect of Abciximab. *Risk X: Avoid combination*

Monitoring ParametersObserve patient for signs of circulatory overload and/or monitor central venous pressure; observe patients closely during the first minute of infusion and have other means of maintaining circulation should dextran therapy result in an anaphylactoid reaction; monitor hemoglobin and hematocrit, electrolytes, serum protein
Nursing: Physical Assessment/MonitoringPatient should be monitored closely for fluid overload, anaphylactoid reaction, and bleeding (eg, fluid status [oliguria/anuria], vital signs, and CVP) during first 15 minutes of first hour and periodically thereafter. Other means of maintaining circulation (eg, with epinephrine and diphenhydramine) should be available in the event of an anaphylactoid reaction. Patient teaching should be appropriate to patient condition.
Monitoring: Lab TestsHemoglobin and hematocrit, electrolytes, serum protein
Patient EducationSince this medication is generally used in emergency situations, patient education should be appropriate to patient condition.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed in D_5W; low molecular weight]:

LMD®: 10% Dextran 40 (500 mL)

Infusion [premixed in NS; high molecular weight]:

Gentran®: 6% Dextran 70 (500 mL)

Infusion [premixed in NS; low molecular weight]:

LMD®: 10% Dextran (500 mL)

Generic AvailableNo
Mechanism of ActionProduces plasma volume expansion by virtue of its highly colloidal starch structure, similar to albumin
Pharmacodynamics/Kinetics

Onset of action: Minutes to 1 hour (depending upon the molecular weight polysaccharide administered)

Excretion: Urine (~75%) within 24 hours

Pharmacotherapy PearlsDextran 40 is known as low molecular weight dextran (LMD®) and has an average molecular weight of 40,000; dextran 75 has an average molecular weight of 75,000. Dextran 70 has an average molecular weight of 70,000; sodium content of 500 mL is 77 mEq, with pH ranging from 3.0-7.0.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular ConsiderationsDextran use in patients with restrictive cardiovascular disease, renal or hepatic impairment should be used with extreme caution. Dextran can also result in an anaphylactoid reaction. Patients should be observed closely during the first several minutes of the infusion in case anaphylactoid reaction occurs. Use caution with concurrent use of antiplatelet medications. Monitor closely for bleeding.
Anesthesia and Critical Care Concerns/Other ConsiderationsDextran should be used with extreme caution in patients with restrictive cardiovascular disease and renal or hepatic impairment. Patients should be observed closely during the first several minutes of the infusion in case anaphylactoid reaction occurs.

Dextran 40 is known as low molecular weight dextran (LMD®) and has an average molecular weight of 40,000.

Dextran 75 has an average molecular weight of 75,000.

Dextran 70 has an average molecular weight of 70,000.

Special Alerts

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children's Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

Adderall® may be confused with Inderal®

Pronunciation(deks troe am FET a meen & am FET a meen)
U.S. Brand NamesAdderall XR®; Adderall®
Canadian Brand NamesAdderall XR®
Pharmacologic CategoryStimulant
Use: Labeled IndicationsAttention-deficit/hyperactivity disorder (ADHD); narcolepsy
Dosing: Adults**Note:** Use lowest effective individualized dose; administer first dose as soon as awake; use intervals of 4-6 hours between additional doses.

ADHD: Oral:

Adderall®: Initial: 5 mg once or twice daily; increase daily dose in 5 mg increments at weekly intervals until optimal response is obtained; usual maximum dose: 40 mg/day given in 1-3 divided doses per day.

Adderall XR®: Initial: 20 mg once daily in the morning; higher doses (up to 60 mg once daily) have been evaluated; however, there is not adequate evidence that higher doses afforded additional benefit

Narcolepsy:*Adderall®*: Oral: Initial: 10 mg/day; increase daily dose in 10 mg increments at weekly intervals until optimal response is obtained; maximum dose: 60 mg/day given in 1-3 divided doses per day with intervals of 4-6 hours between doses.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Note: Use lowest effective individualized dose; administer first dose as soon as awake

ADHD: Oral:

Children: <3 years: Not recommended.

Children: 3-5 years (Adderall®): Initial 2.5 mg/day given every morning; increase daily dose in 2.5 mg increments at weekly intervals until optimal response is obtained; maximum dose: 40 mg/day given in 1-3 divided doses per day. Use intervals of 4-6 hours between additional doses.

Children: ≥6 years:

Adderall®: Initial: 5 mg once or twice daily; increase daily dose in 5 mg increments at weekly intervals until optimal response is obtained; usual maximum dose: 40 mg/day given in 1-3 divided doses per day. Use intervals of 4-6 hours between additional doses.

Adderall XR®: 5-10 mg once daily in the morning; if needed, may increase daily dose in 5-10 mg increments at weekly intervals (maximum dose: 30 mg/day)

Adolescents 13-17 years (Adderall XR®): 10 mg once daily in the morning; maybe increased to 20 mg/day after 1 week if symptoms are not controlled; higher doses (up to 60 mg)/day have been evaluated; however, there is not adequate evidence that higher doses afforded additional benefit.

Narcolepsy:*Adderall®*: Oral:

Children: 6-12 years: Initial: 5 mg/day; increase daily dose in 5 mg increments at weekly intervals until optimal response is obtained; maximum dose: 60 mg/day given in 1-3 divided doses per day with intervals of 4-6 hours between doses.

Children >12 years: Refer to adult dosing.

Administration: Oral

Adderall®: To avoid insomnia, last daily dose should be administered no less than 6 hours before retiring.

Adderall XR®: Should be given by noon. Capsule may be swallowed whole or it may be opened and the contents sprinkled on applesauce. Applesauce should be consumed immediately without chewing. Do not divide the contents of the capsule.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.
RestrictionsC-II

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to dextroamphetamine, amphetamine, or any component of the formulation; advanced arteriosclerosis; symptomatic cardiovascular disease; moderate to severe hypertension; hyperthyroidism; hypersensitivity or idiosyncrasy to the sympathomimetic amines; glaucoma; agitated states; patients with a history of drug abuse; with or within 14 days following MAO inhibitor (hypertensive crisis)

Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Drug abuse: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Cardiovascular events: **[U.S. Boxed Warning]: Use has been associated with serious cardiovascular events including sudden death in patients with pre-existing structural cardiac abnormalities or other serious heart problems (sudden death in children and adolescents; sudden death, stroke and MI in adults).** These products should be avoided in the patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry. Patients should be carefully evaluated for cardiac disease prior to initiation of therapy.
- CNS effects: Amphetamines may impair the ability to engage in potentially hazardous activities.
- Visual disturbance: Difficulty in accommodation and blurred vision has been reported with the use of stimulants.

Disease-related concerns:

- Drug abuse: **[U.S. Boxed Warning]: Potential for drug dependency exists; prolonged use may lead to drug dependency.** Use is contraindicated in patients with history of ethanol or drug abuse. Prescriptions should be written for the smallest quantity consistent with good patient care to minimize possibility of overdose.
- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate. Use is contraindicated in patients with moderate to severe hypertension.
- Psychiatric disorders: Use with caution in patients with pre-existing psychosis or bipolar disorder (may induce mixed/manic episode). May exacerbate symptoms of behavior and thought disorder in psychotic patients; new onset psychosis or mania may occur with stimulant use; observe for symptoms of aggression and/or hostility.
- Seizure disorder: Use with caution in patients with a history of seizure disorder; may lower seizure threshold leading to new onset or breakthrough seizure activity.
- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 years of age. Appetite suppression may occur; monitor weight during therapy, particularly in children. Use of stimulants has been associated with suppression of growth; monitor growth rate during treatment.

Other warnings/precautions:

- Discontinuation of therapy: Abrupt discontinuation following high doses or for prolonged periods may result in symptoms for withdrawal.

Pregnancy Risk FactorC

Pregnancy ConsiderationsUse during pregnancy may lead to increased risk of premature delivery and low birth weight. Infants may experience symptoms of withdrawal. Teratogenic effects were reported when taken during the 1st trimester.

LactationEnters breast milk/contraindicated

Adverse Reactions

As reported with Adderall XR®:

>10%:

Central nervous system: Insomnia (12% to 27%), headache (up to 26% in adults)

Gastrointestinal: Appetite decreased (22% to 36%), abdominal pain (11% to 14%), dry mouth (2% to 35%), weight loss (4% to 11%)

1% to 10%:

Cardiovascular: Tachycardia (up to 6% in adults), palpitation (2% to 4%)

Central nervous system: Emotional lability (2% to 9%), agitation (up to 8% in adults), anxiety (8%), dizziness (2% to 7%), nervousness (6%), fever (5%), somnolence (2% to 4%)

Dermatologic: Photosensitization (2% to 4%)

Endocrine & metabolic: Dysmenorrhea (2% to 4%), impotence (2% to 4%), libido decreased (2% to 4%)

Gastrointestinal: Nausea (2% to 8%), vomiting (2% to 7%), diarrhea (2% to 6%), constipation (2% to 4%), dyspepsia (2% to 4%), tooth disorder (2% to 4%)

Genitourinary: Urinary tract infection (5%)

Neuromuscular & skeletal: Twitching (2% to 4%), weakness (2% to 6%)

Respiratory: Dyspnea (2% to 4%)

Miscellaneous: Diaphoresis (2% to 4%), infection (2% to 4%), speech disorder (2% to 4%)

<1% (Limited to important or life-threatening): MI, seizure, stroke, sudden death

Adverse reactions reported with other amphetamines include: Anaphylaxis, angioedema, anorexia, cardiomyopathy, depression, dyskinesia, dysphoria, euphoria, exacerbation of motor and phonic tics, exacerbation of Tourette's syndrome, hypertension, MI, overstimulation, psychosis, rash, restlessness, seizure, stroke, taste disturbance, tremor, urticaria

Metabolism/Transport EffectsAmphetamine: **Inhibits** CYP2D6 (weak)

Drug Interactions

Alkalinizing Agents: May decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Ammonium Chloride: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Analgesics (Opioid): Amphetamines may enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Antihistamines: Amphetamines may diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antipsychotics: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Amphetamines. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Ethosuximide: Amphetamines may diminish the therapeutic effect of Ethosuximide. Amphetamines may decrease the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

Gastrointestinal Acidifying Agents: May decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Methenamine: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

PHENobarbital: Amphetamines may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Amphetamines may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Dextroamphetamine serum levels may be altered if taken with acidic food, juices, or vitamin C. Avoid caffeine.

Herb/Nutraceutical: Avoid ephedra (may cause hypertension or arrhythmias).

Test InteractionsMay interfere with urinary steroid testing

Monitoring ParametersCNS activity, blood pressure, pulse; height, weight, growth parameters; appetite; signs/symptoms of tolerance or dependence

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008).

Nursing: Physical Assessment/MonitoringSee individual agent for Dextroamphetamine.

Patient EducationSee individual agent for Dextroamphetamine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release:

- Adderall XR®:
  - 5 mg [dextroamphetamine sulfate 1.25 mg, dextroamphetamine saccharate 1.25 mg, amphetamine aspartate monohydrate 1.25 mg, amphetamine sulfate 1.25 mg (equivalent to amphetamine base 3.1 mg)]
  - 10 mg [dextroamphetamine sulfate 2.5 mg, dextroamphetamine saccharate 2.5 mg, amphetamine aspartate monohydrate 2.5 mg, amphetamine sulfate 2.5 mg (equivalent to amphetamine base 6.3 mg)]
  - 15 mg [dextroamphetamine sulfate 3.75 mg, dextroamphetamine saccharate 3.75 mg, amphetamine aspartate monohydrate 3.75 mg, amphetamine sulfate 3.75 mg (equivalent to amphetamine base 9.4 mg)]
  - 20 mg [dextroamphetamine sulfate 5 mg, dextroamphetamine saccharate 5 mg, amphetamine aspartate monohydrate 5 mg, amphetamine sulfate 5 mg (equivalent to amphetamine base 12.5 mg)]
  - 25 mg [dextroamphetamine sulfate 6.25 mg, dextroamphetamine saccharate 6.25 mg, amphetamine aspartate monohydrate 6.25 mg, amphetamine sulfate 6.25 mg (equivalent to amphetamine base 15.6 mg)]
  - 30 mg [dextroamphetamine sulfate 7.5 mg, dextroamphetamine saccharate 7.5 mg, amphetamine aspartate monohydrate 7.5 mg, amphetamine sulfate 7.5 mg (equivalent to amphetamine base 18.8 mg)]

Tablet:

- 5 mg [dextroamphetamine sulfate 1.25 mg, dextroamphetamine saccharate 1.25 mg, amphetamine aspartate monohydrate 1.25 mg, amphetamine sulfate 1.25 mg (equivalent to amphetamine base 3.13 mg)]
- 7.5 mg [dextroamphetamine 1.875 mg, dextroamphetamine saccharate 1.875 mg, amphetamine aspartate monohydrate 1.875 mg, amphetamine sulfate 1.875 mg (equivalent to amphetamine base 4.7 mg)]
- 10 mg [dextroamphetamine sulfate 2.5 mg, dextroamphetamine saccharate 2.5 mg, amphetamine aspartate monohydrate 2.5 mg, amphetamine sulfate 2.5 mg (equivalent to amphetamine base 6.3 mg)]
- 12.5 mg [dextroamphetamine sulfate 3.125 mg, dextroamphetamine saccharate 3.125 mg, amphetamine aspartate monohydrate 3.125 mg, amphetamine sulfate 3.125 mg (equivalent to amphetamine base 7.8 mg)]
- 15 mg [dextroamphetamine sulfate 3.75 mg, dextroamphetamine saccharate 3.75 mg, amphetamine aspartate monohydrate 3.75 mg, amphetamine sulfate 3.75 mg (equivalent to amphetamine base 9.4 mg)]
- 20 mg [dextroamphetamine sulfate 5 mg, dextroamphetamine saccharate 5 mg, amphetamine aspartate monohydrate 5 mg, amphetamine sulfate 5 mg (equivalent to amphetamine base 12.6 mg)]
- 30 mg [dextroamphetamine sulfate 7.5 mg, dextroamphetamine saccharate 7.5 mg, amphetamine aspartate monohydrate 7.5 mg, amphetamine sulfate 7.5 mg (equivalent to amphetamine base 18.8 mg)]
- Adderall®:
  - 5 mg [dextroamphetamine sulfate 1.25 mg, dextroamphetamine saccharate 1.25 mg, amphetamine aspartate monohydrate 1.25 mg, amphetamine sulfate 1.25 mg (equivalent to amphetamine base 3.13 mg)]
  - 7.5 mg [dextroamphetamine 1.875 mg, dextroamphetamine saccharate 1.875 mg, amphetamine aspartate monohydrate 1.875 mg, amphetamine sulfate 1.875 mg (equivalent to amphetamine base 4.7 mg)]
  - 10 mg [dextroamphetamine sulfate 2.5 mg, dextroamphetamine saccharate 2.5 mg, amphetamine aspartate monohydrate 2.5 mg, amphetamine sulfate 2.5 mg (equivalent to amphetamine base 6.3 mg)]
  - 12.5 mg [dextroamphetamine sulfate 3.125 mg, dextroamphetamine saccharate 3.125 mg, amphetamine aspartate monohydrate 3.125 mg, amphetamine sulfate 3.125 mg (equivalent to amphetamine base 7.8 mg)]
  - 15 mg [dextroamphetamine sulfate 3.75 mg, dextroamphetamine saccharate 3.75 mg, amphetamine aspartate monohydrate 3.75 mg, amphetamine sulfate 3.75 mg (equivalent to amphetamine base 9.4 mg)]
  - 20 mg [dextroamphetamine sulfate 5 mg, dextroamphetamine saccharate 5 mg, amphetamine aspartate monohydrate 5 mg, amphetamine sulfate 5 mg (equivalent to amphetamine base 12.6 mg)]
  - 30 mg [dextroamphetamine sulfate 7.5 mg, dextroamphetamine saccharate 7.5 mg, amphetamine aspartate monohydrate 7.5 mg, amphetamine sulfate 7.5 mg (equivalent to amphetamine base 18.8 mg)]

30 mg (20): $26.66

Mechanism of ActionBlocks reuptake of dopamine and norepinephrine from the synapse, thus increases the amount of circulating dopamine and norepinephrine in cerebral cortex to reticular activating system; inhibits the action of monoamine oxidase and causes catecholamines to be released. Peripheral actions include elevation of blood pressure, weak bronchodilation, and respiratory stimulation.

Pharmacodynamics/Kinetics

Onset: 30-60 minutes

Duration: 4-6 hours

Absorption: Well-absorbed

Distribution: V_d: Adults: 3.5-4.6 L/kg; concentrates in breast milk (avoid breast-feeding); distributes into CNS, mean CSF concentrations are 80% of plasma

Half-life elimination:

Children 6-12 years: d-amphetamine: 9 hours; l-amphetamine: 11 hours

Adolescents 13-17 years: d-amphetamine: 11 hours; l-amphetamine: 13-14 hours

Adults: d-amphetamine: 10 hours; l-amphetamine: 13 hours

Metabolism: Hepatic via cytochrome P450 monooxygenase and glucuronidation

Time to peak: T_{max}: Adderall®: 3 hours; Adderall XR®: 7 hours

Excretion: Urine (highly dependent on urinary pH); 70% of a single dose is eliminated within 24 hours; excreted as unchanged amphetamine (30%, may range from ~1% in alkaline urine to ~75% in acidic urine), benzoic acid, hydroxyamphetamine, hippuric acid, norephedrine, and *p*-hydroxynorephedrine

Related Information

- Stimulant Agents Used for ADHD

Pharmacotherapy PearlsTreatment of ADHD may include "drug holidays" or periodic discontinuation of medication in order to assess the patient's requirements, decrease tolerance, and limit suppression of linear growth and weight; the combination of equal parts of *d*, *l*-amphetamine aspartate, *d*, *l*-amphetamine sulfate, dextroamphetamine saccharate and dextroamphetamine sulfate results in a 75:25 ratio of the dextro and levo isomers of amphetamine.

The duration of action of Adderall® is longer than methylphenidate; behavioral effects of a single morning dose of Adderall® may last throughout the school day; a single morning dose of Adderall® has been shown in several studies to be as effective as twice daily dosing of methylphenidate for the treatment of ADHD (see Pelham et al, *Pediatrics*, 1999, 104(6):1300-11; Manos 1999; Pliszka 2000).

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tooth disorder; up to 10% of patients taking dextroamphetamines may present with hypertension. Monitor blood pressure prior to using local anesthetic with vasoconstrictors.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse vasoconstrictor with caution in patients taking dextroamphetamine. Amphetamines enhance the sympathomimetic response of epinephrine and norepinephrine leading to potential hypertension and cardiotoxicity.

Cardiovascular ConsiderationsAmphetamines should be avoided in patients with known or suspected cardiovascular disease. They may precipitate marked increases in blood pressure, tachycardia, and tachyarrhythmias. These drugs are often used recreationally and inappropriately, particularly for appetite suppressant effects. Recreational use of amphetamines should be considered in otherwise healthy patients with new onset hypertension, tachycardia, or tachyarrhythmias.

There have been cases of sudden death, heart-related death, and stroke in children and adults taking regular recommended doses of Adderall® and Adderall XR®. In Canada, sales of Adderall XR® were suspended for about six months, but have now resumed. Education and additional surveillance will be done of all stimulants used to treat attention deficit hyperactivity disorder. According to the FDA, five of the 12 reported cases of sudden death in pediatric patients occurred in children with cardiac risk factors, including undiagnosed cardiac abnormalities. The other seven cases were complicated by other illness, rigorous exercise, or family history of ventricular arrhythmia. In addition, unexplained or unusual drug accumulation (resulting in toxic levels despite usual dosing) has been noted in several cases. The drug should not be used in patients with structural heart disease. Further information is available at the following websites:

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children’s Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

Dexedrine® may be confused with dextran, Excedrin®

Dextroamphetamine may be confused with dexamethasone

Pronunciation(deks troe am FET a meen)
U.S. Brand NamesDexedrine®; DextroStat®; Liquadd™
Canadian Brand NamesDexedrine®
Pharmacologic CategoryStimulant
Use: Labeled IndicationsNarcolepsy; attention-deficit/hyperactivity disorder (ADHD)
Use: Unlabeled/InvestigationalExogenous obesity; depression; abnormal behavioral syndrome in children (minimal brain dysfunction)
Dosing: Adults

Narcolepsy: Oral: Initial: 10 mg/day, may increase at 10 mg increments in weekly intervals until side effects appear; maximum: 60 mg/day

Exogenous obesity (short-term adjunct): Oral: 5-30 mg/day in divided doses of 5-10 mg 30-60 minutes before meals

Dosing: ElderlyRefer to adult dosing; start at lowest dose. Use with caution.
Dosing: Pediatric

Narcolepsy: Oral: Children 6-12 years: Initial: 5 mg/day, may increase at 5 mg increments in weekly intervals until side effects appear; maximum dose: 60 mg/day

Attention-deficit/hyperactivity disorder (ADHD): Oral:

Children 3-5 years: Initial: 2.5 mg/day given every morning; increase by 2.5 mg/day in weekly intervals until optimal response is obtained, usual range: 0.1-0.5 mg/kg/dose every morning with maximum of 40 mg/day

Children ≥6 years: 5 mg once or twice daily; increase in increments of 5 mg/day at weekly intervals until optimal response is reached, usual range: 0.1-0.5 mg/kg/dose every morning (5-20 mg/day) with maximum of 40 mg/day

Administration: OralDo not crush sustained release drug product. Administer as single dose in morning or as divided doses with breakfast and lunch. Should be administered 30 minutes before meals and at least 6 hours before bedtime.
Dietary ConsiderationsShould be taken 30 minutes before meals and at least 6 hours before bedtime.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.
RestrictionsC-II

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity or idiosyncrasy to dextroamphetamine, other sympathomimetic amines, or any component of the formulation; advanced arteriosclerosis, symptomatic cardiovascular disease, moderate-to-severe hypertension; hyperthyroidism; glaucoma; agitated states; patients with a history of drug abuse; during or within 14 days following MAO inhibitor therapy
Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Drug abuse: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Cardiovascular events: **[U.S. Boxed Warning]: Use has been associated with serious cardiovascular events including sudden death in patients with pre-existing structural cardiac abnormalities or other serious heart problems (sudden death in children and adolescents; sudden death, stroke and MI in adults).** These products should be avoided in the patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry. Patients should be carefully evaluated for cardiac disease prior to initiation of therapy.
- CNS effects: Amphetamines may impair the ability to engage in potentially hazardous activities (driving, operating machinery).
- Visual disturbance: Difficulty in accommodation and blurred vision has been reported with the use of stimulants.

Disease-related concerns:

- Drug abuse: **[U.S. Boxed Warning]: Potential for drug dependency exists; prolonged use may lead to drug dependency.** Use is contraindicated in patients with history of ethanol or drug abuse. Prescriptions should be written for the smallest quantity consistent with good patient care to minimize possibility of overdose.
- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate. Use is contraindicated in patients with moderate to severe hypertension.
- Psychiatric disorders: Use with caution in patients with pre-existing psychosis or bipolar disorder (may induce mixed/manic episode). May exacerbate symptoms of behavior and thought disorder in psychotic patients; new onset psychosis or mania may occur with stimulant use; observe for symptoms of aggression and/or hostility.
- Seizure disorder: Use with caution in patients with a history of seizure disorder; may lower seizure threshold leading to new onset or breakthrough seizure activity.
- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 years of age; Dexedrine® is not recommended for use in children <6 years of age. Appetite suppression may occur; monitor weight during therapy, particularly in children. Use of stimulants has been associated with suppression of growth; monitor growth rate during treatment.

Dosage form specific issues:

- Tartrazine: Products may contain tartrazine; use with caution in potentially sensitive individuals.

Other warnings/precautions:

- Discontinuation of therapy: Abrupt discontinuation following high doses or for prolonged periods may result in symptoms for withdrawal.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic and embryocidal effects have been observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if potential benefit justifies the potential risk to the fetus.
LactationEnters breast milk/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiomyopathy, hypertension, palpitation, tachycardia

Central nervous system: Aggression, dizziness, dyskinesia, dysphoria, euphoria, exacerbation of motor and phonic tics, headache, insomnia, mania, overstimulation, psychosis, restlessness, Tourette's syndrome

Dermatologic: Rash, urticaria

Endocrine & metabolic: Libido changes

Gastrointestinal: Anorexia, constipation, diarrhea, unpleasant taste, weight loss, xerostomia

Genitourinary: Impotence

Neuromuscular & skeletal: Tremor

Ocular: Accommodation abnormalities, blurred vision

Drug Interactions

Alkalinizing Agents: May decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Ammonium Chloride: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Analgesics (Opioid): Amphetamines may enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Antihistamines: Amphetamines may diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antipsychotics: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Amphetamines. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Ethosuximide: Amphetamines may diminish the therapeutic effect of Ethosuximide. Amphetamines may decrease the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

Gastrointestinal Acidifying Agents: May decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Methenamine: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

PHENobarbital: Amphetamines may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Amphetamines may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Dextroamphetamine serum levels may be altered if taken with acidic food, juices, or vitamin C.

Herb/Nutraceutical: Avoid ephedra (may cause hypertension or arrhythmias).

Test InteractionsAmphetamines may elevate plasma corticosteroid levels; may interfere with urinary steroid determinations.

Monitoring ParametersCardiac evaluation should be completed on any patient who develops chest pain, unexplained syncope, and any symptom of cardiac disease during treatment with stimulants; growth in children and CNS activity in all

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008).

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for history of psychopathology, homicidal or suicidal tendencies, or addiction; long-term use can result in dependence, abuse, or tolerance. Perform careful cardiovascular assessment prior to initiating therapy. Periodically evaluate the need for continued use. Monitor therapeutic effectiveness, vital signs, and adverse reactions at start of therapy, when changing dosage, and at regular intervals during therapy. Monitor serum glucose closely in patients with diabetes (amphetamines may alter antidiabetic requirements). Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, possible side effects, and symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency without consulting prescriber. Drug may cause physical and/or psychological dependence. Take early in day to avoid sleep disturbance, 30 minutes before meals. Avoid alcohol, caffeine, or OTC medications that act as stimulants. You may experience restlessness, false sense of euphoria, or impaired judgment (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth (frequent mouth care, sucking lozenges, or chewing gum may help); nausea or vomiting (small frequent meals, frequent mouth care may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or altered libido (reversible). Patients with diabetes need to monitor serum glucose closely (may alter antidiabetic medication requirements). Report chest pain, palpitations, or irregular heartbeat; extreme fatigue or depression; CNS changes (aggressiveness, restlessness, euphoria, sleep disturbances); severe unremitting abdominal distress or cramping; blackened stool; changes in sexual activity; or blurred vision. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release, as sulfate: 5 mg, 10 mg, 15 mg

Capsule, sustained release, as sulfate:

Dexedrine® Spansule®: 5 mg, 10 mg, 15 mg

Tablet, as sulfate: 5 mg, 10 mg

DextroStat®: 5 mg, 10 mg [contains tartrazine]

Solution, oral, as sulfate:

Liquadd™: 5 mg/5 mL (480 mL) [contains benzoic acid; bubblegum flavor]

Generic AvailableYes: Excludes oral suspension

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Dexedrine)

10 mg (20): $53.50

15 mg (20): $50.66

Capsule, 24-hour (Dextroamphetamine Sulfate CR)

10 mg (20): $39.99

15 mg (20): $49.99

Tablets (Dextroamphetamine Sulfate)

5 mg (20): $11.99

10 mg (20): $14.99

Tablets (DextroStat)

10 mg (20): $17.99

Mechanism of Action

Amphetamines are noncatecholamine, sympathomimetic amines. Blocks reuptake of dopamine and norepinephrine from the synapse, thus increases the amount of circulating dopamine and norepinephrine in cerebral cortex to reticular activating system; inhibits the action of monoamine oxidase and causes catecholamines to be released. Peripheral actions include elevated blood pressure, weak bronchodilator, and respiratory stimulant action.

Pharmacodynamics/Kinetics

Onset of action: 1-1.5 hours

Distribution: V_d: Adults: 3.5-4.6 L/kg; distributes into CNS; mean CSF concentrations are 80% of plasma; enters breast milk

Metabolism: Hepatic via CYP monooxygenase and glucuronidation

Half-life elimination: Adults: 10-13 hours

Time to peak, serum: T_{max}: Immediate release: ~3 hours; sustained release: ~8 hours

Excretion: Urine (as unchanged drug and inactive metabolites)

Related Information

- Stimulant Agents Used for ADHD

Dental Health: Effects on Dental Treatment

Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Up to 10% of patients taking dextroamphetamines may present with hypertension. Monitor blood pressure prior to using local anesthetic with vasoconstrictors.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

Use vasoconstrictor with caution in patients taking dextroamphetamine. Amphetamines enhance the sympathomimetic response of epinephrine and norepinephrine leading to potential hypertension and cardiotoxicity.

Cardiovascular Considerations

Amphetamines should be avoided in patients with known or suspected cardiovascular disease. They may precipitate marked increases in blood pressure, tachycardia, and tachyarrhythmias. These drugs are often used recreationally and inappropriately, particularly for appetite suppressant effects. Recreational use of amphetamines should be considered in otherwise healthy patients with new onset hypertension, tachycardia, or tachyarrhythmias.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

Pronunciation(deks troe meth OR fan, klor fen IR a meen, fen il EF rin, & gwye FEN e sin)

U.S. Brand NamesChlordex GP; Donatussin; Quartuss™

Pharmacologic CategoryAlpha/Beta Agonist; Antitussive; Expectorant; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of dry, nonproductive cough and upper respiratory symptoms associated with infections such as the common cold, bronchitis, or sinusitis

Dosing: AdultsCough, cold symptoms (Donatussin): Oral: 10 mL every 6 hours as needed (maximum: 40 mL/24 hours)

Dosing: Elderly

Refer to adult dosing.

Dosing: PediatricCough, cold symptoms (Donatussin): Oral:

Children 2-6 years: 2.5 mL every 6 hours as needed (maximum: 10 mL/24 hours)

Children 6-12 years: 5 mL every 6 hours as needed (maximum: 20 mL/24 hours)

Children ≥12 years: Refer to adult dosing.

Administration: OralAdminister with water.
Dietary ConsiderationsTake with food, water or milk to decrease stomach upset.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to dextromethorphan, chlorpheniramine, phenylephrine, guaifenesin, sympathomimetic amines, or any component of the formulation; hypertension; hyperthyroidism, prostatic hyperplasia; use with or within 14 days of discontinuing MAO inhibitor
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; contraindicated in patients with hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Peripheral vascular disease: Use with caution in patients with peripheral vascular disease.

- Respiratory disease: Use with caution in patients with asthma or other chronic respiratory disorders.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Antihistamines may cause excitation in young children. Safety and efficacy have not been established in children <2 years of age.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. See individual agents.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsPhenylephrine is excreted in breast milk. See individual agents.
Adverse ReactionsSee individual agents.
Metabolism/Transport Effects

Chlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Dextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Test InteractionsGuaifenesin: Possible color interference with determination of 5-HIAA and VMA; discontinue for 48 hours prior to test
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup:

Chlordex GP®: Dextromethorphan hydrobromide 7.5 mg, chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 10 mg, and guaifenesin 100 mg per 5 mL (480 mL) [grape flavor]

Donatussin: Dextromethorphan hydrobromide 15 mg, chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 10 mg, and guaifenesin 100 mg per 5 mL (480 mL) [alcohol free; contains propylene glycol; cherry flavor]

Quartuss™: Dextromethorphan hydrobromide 15 mg, chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 10 mg, and guaifenesin 100 mg per 5 mL (480 mL) [alcohol free, sugar free; contains sodium benzoate, propylene glycol; cherry flavor]

Generic AvailableYes
Mechanism of ActionSee individual agents.
Pharmacodynamics/KineticsSee individual agents.
Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, insomnia, irritability, or nervousness
Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors or within 14 days of MAO inhibitor
Index TermsChlorpheniramine, Dextromethorphan, Phenylephrine, and Guaifenesin; Guaifenesin, Chlorpheniramine, Phenylephrine, and Dextromethorphan; Phenylephrine Hydrochloride, Chlorpheniramine maleate, Dextromethorphan Hydrobromide, and Guaifenesin

Pronunciation(deks troe meth OR fan & klor fen IR a meen)

U.S. Brand NamesCoricidin® HBP Cough & Cold [OTC]; Dimetapp® Children’s Long Acting Cough Plus Cold [OTC]; Robitussin® Children’s Cough & Cold Long-Acting [OTC]; Robitussin® Cough & Cold Long-Acting [OTC]; Scot-Tussin® DM Maximum Strength [OTC]

Pharmacologic CategoryAntitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of runny nose, sneezing, itchy/watery eyes, cough, and other upper respiratory symptoms associated with hay fever, common cold, or upper respiratory allergies

Dosing: AdultsGeneral dosing guidelines; consult specific product labeling.

Cough, cold symptoms: Oral: Dextromethorphan 30 mg and chlorpheniramine 4 mg every 6 hours as needed (maximum: 120 mg dextromethorphan and 16 mg chlorpheniramine/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricGeneral dosing guidelines; consult specific product labeling.

Cough, cold symptoms: Oral:

Children 6-11 years: Dextromethorphan 15 mg and chlorpheniramine 2 mg every 6 hours as needed (maximum: 60 mg dextromethorphan and 8 mg chlorpheniramine/24 hours)

Children ≥12 years: Refer to adult dosing.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsUse with or within 14 days of discontinuing MAO inhibitor

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: Antihistamines may cause excitation in young children. Do not exceed pediatric dosing recommendations. If no recommendations exist on OTC labeling for patient's age, the product should **not** be administered without the guidance of a physician. Not for OTC use in children <6 years of age.

Other warnings/precautions:

- Self-medication (OTC use): Patients with glaucoma or prostatic hyperplasia should consult healthcare provider prior to use. Patients with chronic cough (associated with COPD or smoking) and/or productive cough (eg, copious amounts of phlegm) should be evaluated by a healthcare provider prior to use. Ask healthcare provider prior to using with sedatives. If cough does not improve, is accompanied by rash, fever, or headache, or persists >7 days during use, discontinue use and consult a physician. Do not exceed recommended dose.

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. See individual agents.

Adverse ReactionsSee individual agents.

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Syrup:

Dimetapp® Children’s Long Acting Cough Plus Cold: Dextromethorphan hydrobromide 7.5 mg and chlorpheniramine maleate 1 mg per 5 mL (118 mL) [alcohol free, sugar free; contains sodium benzoate, propylene glycol; grape flavor]

Robitussin® Children’s Cough and Cold Long-Acting: Dextromethorphan hydrobromide 15 mg and chlorpheniramine maleate 2 mg per 5 mL (118 mL) [alcohol free, sugar free; contains sodium benzoate, propylene glycol, fruit punch flavor]

Robitussin® Cough and Cold Long-Acting: Dextromethorphan hydrobromide 7.5 mg and chlorpheniramine maleate 1 mg per 5 mL (118 mL) [alcohol free, sugar free; contains sodium benzoate, propylene glycol]

Scot-Tussin® DM Maximum Strength: Dextromethorphan hydrobromide 15 mg and chlorpheniramine maleate 2 mg per 5 mL (118 mL) [alcohol free, sugar free, cherry-strawberry flavor]

Tablet:

Coricidin® HBP Cough and Cold: Dextromethorphan hydrobromide 30 mg and chlorpheniramine maleate 4 mg

Generic AvailableNo

Mechanism of Action

Chlorpheniramine maleate: Antihistamine with H_1-receptor activity

Dextromethorphan: A non-narcotic antitussive, increases cough threshold by its activity on the medulla oblongata

Pharmacodynamics/KineticsSee individual agents.

Mental Health: Effects on Mental StatusMay cause sedation, dizziness, excitability, nervousness

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment. May cause sedation; concurrent use with psychotropics may produce additive effects. Combined use with serotoninergic agents may cause serotonin syndrome. The anticholinergic effects of chlorpheniramine may decrease the effects of acetylcholinesterase inhibitors. However, when combined with psychotropic agents, anticholinergic effects may be additive. Nefazodone may potentiate the effects of chlorpheniramine.

Index TermsChlorpheniramine and Dextromethorphan; Chlorpheniramine Maleate and Dextromethorphan Hydrobromide; Dextromethorphan Hydrobromide and Chlorpheniramine Maleate

Use: Labeled IndicationsSymptomatic relief of coughs caused by minor viral upper respiratory tract infections or inhaled irritants; most effective for a chronic nonproductive cough

Use: Unlabeled/Investigational*N*-methyl-D-aspartate (NMDA) antagonist in cerebral injury

Dosing: AdultsCough suppressant: Oral: 10-20 mg every 4 hours or 30 mg every 6-8 hours; extended release: 60 mg twice daily; maximum: 120 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricCough suppressant: Oral:

<2 years: Use only as directed by a physician

2-6 years (syrup): Oral: 2.5-7.5 mg every 4-8 hours; extended release is 15 mg twice daily (maximum: 30 mg/24 hours)

6-12 years: 5-10 mg every 4 hours or 15 mg every 6-8 hours; extended release is 30 mg twice daily (maximum: 60 mg/24 hours)

Children >12 years: Refer to adult dosing.

Dietary Considerations

Delsym® contains sodium 6 mg/5 mL.

Vicks® 44® Cough Relief contains sodium 10 mg/5 mL.

ContraindicationsHypersensitivity to dextromethorphan or any component of the formulation; do not use with or within 2 weeks of an MAO inhibitor

Warnings/Precautions

Special populations:

- Debilitated patients: Use with caution in patients who are sedated, debilitated or confined to a supine position.
- Pediatrics: Use with caution in atopic children. Not for OTC use in children <2 years of age.

Dosage form specific issues:

- Coconut: Some products may contain coconut oil.
- Tartrazine: Some products may contain tartrazine.

Other warnings/precautions:

- Self-medication (OTC use): When used for self medication (OTC) notify healthcare provider if symptoms do not improve within 7 days, or are accompanied by fever, rash or persistent headache. Do not use for persistent or chronic cough (as with smoking, asthma, chronic bronchitis, emphysema) or if cough is accompanied b excessive phlegm unless directed to do so by healthcare provider.

Pregnancy Risk FactorC

Adverse Reactions<1%: Drowsiness, dizziness, coma, respiratory depression, nausea, GI upset, constipation, abdominal discomfort

Metabolism/Transport Effects**Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Gelcap, as hydrobromide:

Robitussin® CoughGels™: 15 mg [contains coconut oil]

Liquid, as hydrobromide:

Creo-Terpin®: 10 mg/15 mL (120 mL) [contains alcohol 25% and tartrazine]

Vicks® 44® Cough Relief: 10 mg/5 mL (120 mL) [contains alcohol, sodium 10 mg/5 mL, sodium benzoate]

Liquid, oral, as hydrobromide [drops]:

PediaCare® Infants' Long-Acting Cough: 7.5 mg/0.8 mL (15 mL) [alcohol free, dye free; contains sodium benzoate; grape flavor] [DSC]

Lozenge, as hydrobromide:

Hold® DM: 5 mg (10s) [cherry or original flavor]

Scot-Tussin DM® Cough Chasers: 5 mg (20s) [DSC]

Strips, oral, as hydrobromide:

Triaminic® Thin Strips™ Long Acting Cough: 7.5 mg [equivalent to dextromethorphan 5 mg; cherry flavor]

Suspension, extended release:

Delsym®: Dextromethorphan polistirex [equivalent to dextromethorphan hydrobromide 30 mg/5 mL] (78 mL, 148 mL) [contains sodium 6 mg/5 mL; orange flavor]

Syrup, as hydrobromide:

Babee® Cof Syrup: 7.5 mg/5 mL (120 mL) [alcohol free, dye free; cherry flavor]

Creomulsion® Cough: 20 mg/15 mL (120 mL) [alcohol free; contains sodium benzoate]

Creomulsion® for Children: 5 mg/5 mL (120 mL) [alcohol free; contains sodium benzoate; cherry flavor]

ElixSure® Cough: 7.5 mg/5 mL (120 mL) [cherry bubble gum flavor]

Robitussin® Maximum Strength Cough: 15 mg/5 mL (120 mL, 240 mL) [contains alcohol, sodium benzoate]

Robitussin® Pediatric Cough: 7.5 mg/5 mL (120 mL) [alcohol free; contains sodium benzoate; fruit punch flavor]

Silphen DM®: 10 mg/5 mL (120 mL) [strawberry flavor]

Generic AvailableYes: Excludes strip, liquid freezer pop

Mechanism of ActionChemical relative of morphine lacking narcotic properties except in overdose; controls cough by depressing the medullary cough center

Pharmacodynamics/Kinetics

Onset of action: Antitussive: 15-30 minutes

Duration: ≤6 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or depression

Mental Health: Effects on Psychiatric TreatmentUse with MAO inhibitors may cause hypertensive crisis; avoid combination

Medication Safety Issues

Sound-alike/look-alike issues:

Glutose™ may be confused with Glutofac®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (hypertonic solutions ≥20%) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(DEKS trose)

U.S. Brand NamesB-D™ Glucose [OTC]; Dex4® Glucose [OTC]; Enfamil® Glucose; Glutol™ [OTC]; Glutose™ [OTC]; Insta-Glucose® [OTC]; Similac® Glucose

Pharmacologic CategoryHyperglycemic Agent; Intravenous Nutritional Therapy

Use: Labeled Indications

Oral: Treatment of hypoglycemia

5% and 10% solutions: Peripheral infusion to provide calories and fluid replacement

25% (hypertonic) solution: Treatment of acute symptomatic episodes of hypoglycemia in infants and children to restore depressed blood glucose levels; adjunctive treatment of hyperkalemia when combined with insulin

50% (hypertonic) solution: Treatment of insulin-induced hypoglycemia (hyperinsulinemia or insulin shock) and adjunctive treatment of hyperkalemia in adolescents and adults

≥10% solutions: Infusion after admixture with amino acids for nutritional support

Dosing: Adults

Treatment of hypoglycemia: Doses may be repeated in severe cases

Oral: 10-20 g as single dose; repeat in 10 minutes if necessary

I.V.: 10-25 g (40-100 mL of 25% solution or 20-50 mL of 50% solution)

Treatment of hyperkalemia: I.V. (in combination with insulin): 25-50 g dextrose (250-500 mL $D_{10}W$) combined with 10 units regular insulin administered over 30-60 minutes; repeat as needed or as an alternative 25 g dextrose (50 mL $D_{50}W$) combined with 5-10 units regular insulin infused over 5 minutes; repeat as needed

Note: More rapid infusions (<30 minutes) may be associated with hyperglycemia and hyperosmolality and will exacerbate hyperkalemia; avoid use in patients who are already hyperglycemic

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of hypoglycemia: Doses may be repeated in severe cases

Oral: Children >2 years: Refer to adult dosing.

I.V.:

Infants ≤6 months: 0.25-0.5 g/kg/dose (1-2 mL/kg/dose of 25% solution); maximum: 25 g/dose

Infants >6 months and Children: 0.5-1g/kg/dose (2-4 mL/kg/dose of 25% solution); maximum: 25 g/dose

Adolescents: Refer to adult dosing.

Treatment of hyperkalemia: I.V. (in combination with insulin):

Infants and Children: 0.5-1 g/kg (using 25% or 50% solution) combined with regular insulin 1 unit for every 4-5 g dextrose given; infuse over 2 hours (infusions as short as 30 minutes have been recommended); repeat as needed

Adolescents: Refer to adult dosing.

Administration: I.V.Not for SubQ or I.M. administration; dilute concentrated dextrose solutions for peripheral venous administration to a maximum concentration of 12.5%; in emergency situations, 25% dextrose has been used peripherally; for direct I.V. infusion, infuse at a maximum rate of 200 mg/kg over 1 minute; continuous infusion rates very with tolerance and range from 4.5-15 mg/kg/minute; hyperinsulinemic neonates may require up to 15-25 mg/kg/minute infusion rates

Administration: OralMust be swallowed to be absorbed (see Warnings)
StorageStable at room temperature. Protect from freezing and extreme heat. Store oral dextrose in airtight containers.
ContraindicationsHypersensitivity to corn or corn products; diabetic coma with hyperglycemia; hypertonic solutions in patients with intracranial or intraspinal hemorrhage; patients with delirium tremens and dehydration; patients with anuria, hepatic coma, or glucose-galactose malabsorption syndrome
Allergy Considerations

- Dextrose Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hyperglycemia: An unexpected rise in blood glucose level in an otherwise stable patient may be an early symptom of infection. Rapid administration of hypertonic solutions may produce significant hyperglycemia, glycosuria, and shifts in electrolytes; this may result in dehydration, hyperosmolar syndrome, coma, and death especially in patients with chronic uremia or carbohydrate intolerance.

- Hypokalemia: Administration of potassium free I.V. dextrose solutions may result in significant hypokalemia, particularly if highly concentrated dextrose solutions are used; monitor closely and/or add potassium to dextrose solutions for patients with adequate renal function.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; hyperglycemia and glycosuria may be functions of the rate of administration of dextrose; to minimize these effects, reduce the rate of infusion; addition of insulin may be necessary.

Special populations:

- Very low birth weight infants: Excessive or rapid dextrose administration in very low birth weight infants has been associated with increased serum osmolality and possible intracerebral hemorrhage.

Dosage form specific issues:

- Aluminium: Parenteral dextrose solutions contain aluminum which may accumulate to toxic levels with prolonged administration particularly in patients with impaired renal function. Patients with impaired renal function including premature neonates who receive aluminum at >4-5 mcg/kg/day accumulate aluminum at levels associated with CNS and bone toxicity.

- Oral forms: Do not use oral forms in unconscious patients.

Other warnings/precautions:

- Abrupt withdrawal: Rebound hypoglycemia may be associated with abrupt withdrawal.

- Administration: Hypertonic solutions (>10%) may cause thrombosis if infused via peripheral veins; administer hypertonic solutions via a central venous catheter.

Pregnancy Risk FactorC/A (oral)
Adverse ReactionsFrequency not defined. **Note:** Most adverse effects are associated with excessive dosage or rate of infusion.

Cardiovascular: Venous thrombosis, phlebitis, hypovolemia, hypervolemia, dehydration, edema

Central nervous system: Fever, mental confusion, unconsciousness, hyperosmolar syndrome

Endocrine & metabolic: Hyperglycemia, hypokalemia, acidosis, hypophosphatemia, hypomagnesemia

Genitourinary: Polyuria, glycosuria, ketonuria

Gastrointestinal: Polydipsia, nausea, diarrhea (oral)

Local: Pain, vein irritation, tissue necrosis

Respiratory: Tachypnea, pulmonary edema

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersBlood and urine sugar, serum electrolytes, I & O, caloric intake
Reference RangeNormal blood sugar:

Children 0-2 years: 60-105 mg/dL

Children >2 years and Adults: 70-110 mg/dL

Monitoring: Lab TestsBlood and urine sugar, serum electrolytes
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, oral:

Glutose™: 40% (37.5 g) [provides dextrose 15 g/tube; lemon flavor]; (112.5 g) [provides dextrose 45 g/tube; lemon flavor]

Insta-Glucose®: 40% (30 g) [provides dextrose 12 g and additional carbohydrates 12 g/tube; cherry flavor]

Infusion:

Generics:

- 2.5% (1000 mL)
- 5% (25 mL, 50 mL, 100 mL, 150 mL, 250 mL, 500 mL, 1000 mL)
- 10% (250 mL, 500 mL, 1000 mL)
- 20% (500 mL, 1000 mL)
- 30% (500 mL, 1000 mL)
- 40% (500 mL, 1000 mL)
- 50% (500 mL, 1000 mL, 2000 mL)
- 60% (500 mL, 1000 mL)
- 70% (500 mL, 1000 mL, 2000 mL)

Injection, solution: 10% (3 mL, 5 mL); 25% (10 mL); 50% (50 mL)

Solution, oral:

Enfamil® Glucose: 5% (89 mL) [provides dextrose 4 g/bottle]; 10% (89 mL) [provides dextrose 9 g/bottle]

Glutol™: 55% (180 mL) [dextrose 100 g/180 mL]

Similac® Glucose: 5% (60 mL, 120 mL); 10% (60 mL, 120 mL)

Tablet, chewable:

B-D™ Glucose: 5 g (6s) [orange flavor]

Dex4® Glucose: 4 g (10s, 50s) [grape, raspberry, orange, and watermelon flavor]

Generic AvailableYes

Mechanism of ActionDextrose, a monosaccharide, is a source of calories and fluid for patients unable to obtain an adequate oral intake; may decrease body protein and nitrogen losses; promotes glycogen deposition in the liver. When used in the treatment of hyperkalemia (combined with insulin), dextrose stimulates the uptake of potassium by cells, especially in muscle tissue, lowering serum potassium.

Pharmacodynamics/Kinetics

Onset of action: Treatment of hypoglycemia: Oral: 10 minutes

Maximum effect: Treatment of hyperkalemia: I.V.: 30 minutes

Absorption: Oral: Rapidly from the small intestine by an active mechanism

Metabolism: Metabolized to carbon dioxide and water

Time to peak, serum: Oral: 40 minutes

Pharmacotherapy PearlsEach g of I.V. dextrose contains 3.4 kcal; glucose monohydrate 1 g is equal to 1 g anhydrous dextrose; osmolarity of 10% dextrose is 505 mOsm/L and 25% dextrose is 1330 mOsm/L. Normal body fluid osmolarity is 310 mOsm/L.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Jump To Field (Select Field Name)

Pharmacologic Category Chemotherapy Regimen, Lymphoma, non-Hodgkin's

Regimen Use Lymphoma, non-Hodgkin's

Regimen NOTE: Multiple variations are listed below.

Variation 1:

Dexamethasone: I.V. or Oral: 40 mg/day days 1 to 4

[total dose/cycle = 160 mg]

Cisplatin: I.V.: 100 mg/m^2 day 1

[total dose/cycle = 100 mg/m^2]

Cytarabine: I.V.: 2000 mg/m^2 every 12 hours for 2 doses day 2 (begins at the end of the cisplatin infusion)

[total dose/cycle = 4000 mg/m^2]

Repeat cycle every 3-4 weeks for 6-10 cycles (salvage therapy) or 1-2 cycles (mobilization prior to high-dose therapy with peripheral hematopoietic progenitor cell support)

Variation 2:

Dexamethasone: I.V. or Oral: 40 mg/day days 1 to 4

[total dose/cycle = 160 mg]

Oxaliplatin: I.V.: 130 mg/m^2 day 1

[total dose/cycle = 130 mg/m^2]

Cytarabine: I.V.: 2000 mg/m^2 every 12 hours for 2 doses day 2

[total dose/cycle = 4000 mg/m^2]

Repeat cycle every 3 weeks

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(dye a tri ZOE ate MEG loo meen & dye a tri ZOE ate SOW dee um)

U.S. Brand NamesGastrografin®; MD-76®R; MD-Gastroview®; RenoCal-76® [DSC]; Renografin®-60

Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Ionic, High Osmolality)

Use: Labeled Indications

Oral/rectal: Examination of GI tract; adjunct to contrast enhancement in computed tomography of the torso

Injection: Angiocardiography, aortography, central venography, cerebral angiography, cholangiography, digital arteriography, excretory urography, nephrotomography, peripheral angiography, peripheral arteriography, renal arteriography, renal venography, splenoportography, visceral arteriography; contrast enhancement of computed tomographic imaging

Dosing: Adults

Radiographic exam of GI tract segments:

Oral: 30-90 mL

Rectal enema: Dilute 240 mL in 1000 mL tap water

Tomography: Oral: 25-77 mL in 1000 mL tap water 15-30 minutes prior to imaging

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Radiographic exam of GI tract segments:**

Oral:

Children <5 years: 30 mL , dilute 1:1 (if <10 kg or debilitated, dilute 1:3)

Children 5-10 years: 60 mL , dilute 1:1 (if <10 kg or debilitated, dilute 1:3)

Rectal enema:

Children <5 years: Dilute 1:5 in tap water

Children >5 years: Dilute 90 mL in 500 mL tap water

Administration: OralMay be diluted 1:1 with water, carbonated beverage, milk, or mineral oil for children and cachectic elderly; for very young (<10kg) and debilitated children, dilute 1:3 in water.

StorageStore at 20°C to 25°C (68°F to 77°F). Protect from light.

ContraindicationsHypersensitivity to diatrizoate or any component of the formulation; injection is not intended for intrathecal use

Refer to product labeling for procedure-specific contraindications.

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Contrast dye/iodine hypersensitivity: Use with caution in patients with history of previous reaction to contrast dye or iodine.
- Laxative effect: Solutions may be hypertonic and may cause mucosal irritation and intraluminal water movement resulting in laxative effect.

Disease-related concerns:

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction; hyperthyroidism has been reported.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.

- Pediatrics: Use with caution in children.

Other warnings/precautions:

- Monitoring: Monitor hydration and electrolyte status.

Pregnancy Risk FactorB/C (manufacturer dependent)

Pregnancy ConsiderationsDiatrizoate salts cross the placenta and may enter fetal circulation. Abnormal neonatal opacification of the small intestine and colon have been reported in the newborn 4-6 days after delivery. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsDiatrizoate salts are reported to be excreted in human milk. One manufacturer recommends bottle feedings for 24 hours following administration.

Adverse ReactionsFrequency not defined.

Cardiovascular: Tachyarrhythmia

Dermatologic: Urticaria

Gastrointestinal: Diarrhea, nausea, vomiting

Respiratory: Dyspnea, hypoxia

Miscellaneous: Anaphylaxis

Drug Interactions

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Test InteractionsThyroid function tests (protein bound iodine uptake studies) may be inaccurate for up to 1 year after administration; may cause false low trypsin values (determined spectrophotometrically).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, injection:

MD-76®R: Diatrizoate meglumine 660 mg and diatrizoate sodium 100 mg per 1 mL (50 mL, 100 mL, 200 mL) [provides organically-bound iodine 370 mg/mL; contains edetate calcium disodium, sodium 3.65 mg (0.16 mEq)/mL]

RenoCal-76®: Diatrizoate meglumine 660 mg and diatrizoate sodium 100 mg per 1 mL (50 mL) [provides organically-bound iodine 370 mg/mL; contains edetate calcium disodium, sodium 3.69 mg (0.16 mEq)/mL] [DSC]

Renografin®-60: Diatrizoate meglumine 520 mg and diatrizoate sodium 80 mg per 1 mL (50 mL) [provides organically-bound iodine 292.5 mg/mL; contains edetate disodium, sodium 3.76 mg (0.16 mEq)/mL]

Solution, oral/rectal:

Gastrografin®: Diatrizoate meglumine 660 mg and diatrizoate sodium 100 mg per 1 mL (30 mL, 120 mL) [provides organically-bound iodine 367 mg/mL; contains edetate disodium, sodium 4.8 mg (0.21 mEq)/mL; lemon flavor]

MD-Gastroview®: Diatrizoate meglumine 660 mg and diatrizoate sodium 100 mg per 1 mL (30 mL, 120 mL, 240 mL) [provides organically-bound iodine 367 mg/mL; contains edetate disodium, sodium 4.8 mg (0.21 mEq)/mL; lemon-vanilla flavor]

Generic AvailableNo

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(dye a tri ZOE ate MEG loo meen & eye oh DI pa mide MEG loo meen)

U.S. Brand NamesSinografin®

Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Ionic, Low Osmolality)

Use: Labeled IndicationsHysterosalpingography

Dosing: AdultsHysterosalpingography: Intrauterine: Usual dose: 3-4 mL administered in fractional doses of ~1 mL; may give additional 3-4 mL to visualize tubes; total dosage range: 1.5-10 mL

Administration: OtherFor intrauterine use only; administer in fractional doses of ~1 mL

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light. If crystallization occurs, place vial in hot water, and shake gently for several minutes until the solids redissolve. Allow to cool to body temperature before administering. Discard if cloudiness persists.

ContraindicationsHypersensitivity to any component of the formulation; during or within 6 months following pregnancy termination; infection of external genitalia or genital tract; during menstrual period; within 30 days of curettage or conization

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: Use extreme caution with history of previous reaction to contrast dye or iodine-based contrast media or asthma. Severe, potentially life-threatening reactions and delayed reactions may occur. Pretreatment with corticosteroids (eg, prednisone) and antihistamines (eg, diphenhydramine) may be beneficial to decrease the frequency/severity of allergic reactions in "at risk" patients. Equipment for resuscitation and trained personnel experienced in handling emergencies should be immediately available. Monitor closely after injection.

Disease-related concerns:

- Uterine cancer: Use with caution in patients with uterine or uterine tube cancer; procedure may cause dispersion of cancer cells.

Pregnancy ConsiderationsThe procedure for which this product is indicated is contraindicated during or within 6 months of pregnancy. Diatrizoate meglumine crosses the placenta and enters the fetal circulation. Also refer to individual agents.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsDiatrizoate meglumine and iodipamide meglumine have been found in breast milk following intravascular administration.

Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia (rare), cardiac arrest (rare), hypotension, syncope

Central nervous system: Chills, dizziness, fever

Gastrointestinal: Abdominal pain, abdominal tenderness, nausea, vomiting

Miscellaneous: Anaphylactoid reactions, hypersensitivity reactions (including sweating, flushing, pruritus, urticaria, rash, arthralgia, respiratory distress, and circulatory collapse)

Drug Interactions

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Test InteractionsThyroid function tests (protein bound iodine and radioactive iodine uptake) may be inaccurate after administration. If necessary, T_3 resin uptake or free thyroxine assays can be used after iodinated contrast agents to evaluate thyroid function.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [for intrauterine instillation]:

> Sinografin®: Diatrizoate meglumine 527 mg and iodipamide meglumine 268 mg per mL (10 mL) [provides organically-bound iodine 380 mg/mL; contains edetate disodium, sodium 0.91 mg (0.04 mEq)/mL]

Generic AvailableNo

ManufacturerBracco Diagnostics

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(dye a tri ZOE ate MEG loo meen)

U.S. Brand NamesCystografin®; Cystografin® Dilute; Reno-30®; Reno-60® [DSC]; Reno-Dip®

Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Ionic, High Osmolality)

Use: Labeled Indications

Solution for instillation: Retrograde cystourethrography; retrograde or ascending pyelography

Solution for injection: Arthrography, cerebral angiography, direct cholangiography, discography, drip infusion pyelography, excretory urography, peripheral arteriography, splenoportography, venography; contrast enhancement of computed tomographic head and body imaging

Dosing: AdultsDosing is based upon route of administration, type of examination, age of patient, and product used. Consult specific product information for detailed dosing.

Dosing: PediatricRefer to adult dosing.

Administration: I.V.Administer slower in the elderly and heart failure patients. Slow infusion if nausea or flushing occurs. For intravenous use, should be at body temperature for administration. In angiography, use meticulous intravascular administration technique to minimize thrombotic events including frequent catheter flushing, and close attention to catheter and guidewire manipulation. **Note:** Some products (eg, Cystografin®, Reno-30®) are intended only for instillation and are not to be administered I.V.; consult product labeling to avoid inadvertent erroneous administration.

StorageProtect from light. Store at 20°C to 25°C (68°F to 77°F); Hypaque™ should be stored at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to diatrizoate or any component of the formulation; solutions for instillation should not be used for intravascular injection; solutions for injection are not for intrathecal use

Refer to product labeling for procedure-specific contraindications.

Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Intrathecal use: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Allergic reactions: Use extreme caution with history of previous reaction to contrast dye or iodine-based contrast media. Severe, potentially life-threatening, reactions and delayed reactions may occur. Monitor closely after injection.

- Extravasation: Use meticulous intravascular administration technique.

Disease-related concerns:

- Heart failure: Use caution in heart failure.

- Hepatic disease: Use caution in severe hepatic failure. Avoid diagnostic infusion studies in patients with hepatic or biliary disease who have recently taken cholecystographic contrast agent.

- Hypertension: Use caution in hypertension.

- Hyperthyroidism: Use caution; thyroid storm following use of intravascular iodinated contrast agents has been rarely reported.

- Multiple myeloma: Use caution in multiple myeloma; use of intravascular contrast agents may lead to renal dysfunction, especially with concurrent dehydration.

- Pheochromocytoma: Use extreme caution in pheochromocytoma; monitor blood pressure closely.

- Renal disease: Use caution in renal disease. May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in diabetics, the elderly, and those who are dehydrated.

- Sickle cell disease: May exacerbate sickle cell disease.

- Subarachnoid hemorrhage: Use caution in subarachnoid hemorrhage; reports of clinical deterioration have occurred with administration of contrast media.

- Thromboembolism: Serious, rarely fatal, thromboembolic events causing myocardial infarction (MI) and stroke have been reported during angiographic procedures with both ionic and nonionic contrast media. Ionic iodinated contrast media may inhibit blood coagulation. Use meticulous intravascular administration techniques during angiographic procedures.

Dosage form specific issues:

- Instillation: Some products (eg, Cystografin®, Reno-30®) are intended only for instillation and are not to be administered I.V.; consult product labeling to avoid inadvertent erroneous administration.

Other warnings/precautions:

- Intrathecal: **[U.S. Boxed Warning]:** Injectable solution should never be used intrathecally.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Diatrizoate salts cross the placenta and may enter fetal circulation. Abnormal neonatal opacification of the small intestine and colon have been reported in the newborn 4-6 days after delivery. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsDiatrizoate salts are reported to be excreted in human milk

Adverse Reactions

<10%:

Cardiovascular: Flushing (49%)

Gastrointestinal: Taste perversion (11%)

Local: Injection site reaction (12%)

Renal: Nephrosis (excretory urography: 23%)

1% to 10%:

Cardiovascular: Edema, hypertension

Central nervous system: Dizziness (5%), agitation, chills, fever, headache

Dermatologic: Urticaria (1%)

Gastrointestinal: Nausea (6%), vomiting (3%)

Local: Extravasation

Neuromuscular & skeletal: Parasthesia (6%)

Renal: Hematuria (retrograde GU procedures), urinary tract infections (retrograde GU procedures)

Respiratory: Cough (2%), rhinitis (1%), sneezing

Miscellaneous: Allergic reaction, diaphoresis

<1%: Anaphylactic shock, anemia, angioneurotic edema, anuria, apnea, asthma, bradycardia (sinus), bronchospasm, BUN (increased), cardiac arrest, cardiorespiratory failure, chest pain, coma, confusion, conjunctival irritation, creatinine (increased), cyanosis, dyspnea, fibrillation (ventricular), gangrene (extremities), hematoma (cerebral), hypotension, itching eyes, lacrimation, laryngeal edema, leukopenia, neutropenia, oliguria, pain, paresis, parotid glands swelling, petechiae, pruritus, pulmonary edema, pulmonary embolism, rash, renal colic (retrograde GU procedures), renal failure, respiratory arrest, seizure, shock (urography), speech disorder, syncope, tachycardia (reflex), thrombocytopenia, thrombophlebitis, uremia, urinary tract spasm (retrograde GU procedures), ventricular fibrillation

Drug Interactions

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, for instillation:

Cystografin®: 30% (100 mL, 300 mL) [provides organically-bound iodine 141 mg/mL; contains edetate disodium 0.4 mg/mL]

Cystografin® Dilute: 18% (300 mL) [provides organically-bound iodine 85 mg/mL; contains edetate disodium 0.4 mg/mL]

Reno-30®: 30% (50 mL) [provides organically-bound iodine 141 mg/mL; contains edetate disodium 0.4 mg/mL]

Solution, injection:

Reno-60®: 60% (50 mL) [provides organically-bound iodine 282 mg/mL; contains edetate disodium 0.4 mg/mL, sodium 0.91 mg (0.04 mEq)/mL] [DSC]

Reno-Dip®: 30% (300 mL) [provides organically-bound iodine 141 mg/mL; contains edetate disodium 0.4 mg/mL, sodium 0.049 mg (0.002 mEq)/mL]

Generic AvailableNo

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Diatrizoate Sodium

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(dye a tri ZOE ate SOW dee um)
U.S. Brand NamesHypaque™ Sodium
Pharmacologic CategoryIodinated Contrast Media; Radiological/Contrast Media (Ionic, High Osmolality)
Use: Labeled IndicationsRadiographic examination of GI tract
Dosing: Adults Radiographic imaging:

Oral: 25% to 40% solution: 90-180 mL

Rectal: Enema: 15% to 25% solution: 500-1000 mL

Dosing: PediatricRadiographic imaging: Infants and Children:

Oral: 20% to 40% solution: 30-75 mL

Rectal: Enema: 10% to 15% solution: 100-500 mL depending on weight of patient

Administration: OralUse immediately after mixing.
Administration: OtherRectal: Use immediately after mixing.
ReconstitutionOral solution: Mix powder with 100 mL of water, milk or carbonated drink. Carbonated diluents should be avoided when gas artifacts are undesirable. Solutions may be sweetened or flavored (eg, with vanilla, lemon, chocolate).

To make 10% solution, mix 1 level measuring spoonful (10 g) of powder in 100 mL of liquid.

ContraindicationsHypersensitivity to diatrizoate or any component of the formulation
Allergy Considerations

- Contrast Agent, Iodinated, Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Contrast dye/iodine hypersensitivity: Use with caution in patients with history of previous reaction to contrast dye or iodine.
- Laxative effect: Solutions may be hypertonic and may cause mucosal irritation and intraluminal water movement resulting in laxative effect.
- Serious reactions: Parenteral administration of radiopaque media has been associated with serious reactions; may also occur with oral administration.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Patients at risk for aspiration: Should not be used in patients who are at risk of aspiration, including patients with esophagotracheal fistula.
- Renal impairment: Use with caution in patients with severe renal impairment.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.
- Pediatrics: Use with caution in children.

Other warnings/precautions:

- Monitoring: Monitor hydration and electrolyte status.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Diatrizoate salts cross the placenta and may enter fetal circulation. Abnormal neonatal opacification of the small intestine and colon have been reported in the newborn 4-6 days after delivery. In general, iodinated contrast media agents are avoided during pregnancy unless essential for diagnosis.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsDiatrizoate salts are reported to be excreted in human milk.
Adverse ReactionsFrequency not defined.

Dermatologic: Urticaria

Gastrointestinal: Diarrhea, nausea, vomiting

Hematologic: Eosinophilia

Miscellaneous: Anaphylactic reaction

Drug Interactions

MetFORMIN: Iodinated Contrast Agents may enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for solution, oral/rectal:

Hypaque™ Sodium: 100% (250 g) [provides organically-bound iodine 600 mg/g]

Generic AvailableNo

ManufacturerAmersham Health

Mechanism of ActionWhen administered orally or given as an enema, the medium produces excellent opacification and delineation of the upper and lower gastrointestinal tract; however, because of dilution, contrast in the small bowel may be unsatisfactory.

Pharmacodynamics/KineticsAbsorption: Oral: Minimal; Rectal: May result in increased absorption

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Diazepam

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Diazepam may be confused with diazoxide, Ditropan®, LORazepam

Valium® may be confused with Valcyte™

Pronunciation(dye AZ e pam)

U.S. Brand NamesDiastat®; Diastat® AcuDial™; Diazepam Intensol®; Valium®

Canadian Brand NamesApo-Diazepam®; Diastat®; Diastat® Rectal Delivery System; Diazemuls®; Novo-Dipam; Valium®

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsManagement of anxiety disorders, ethanol withdrawal symptoms; skeletal muscle relaxant; status epilepticus; muscle spasm associated with tetanus

Rectal gel: Management of selected, refractory epilepsy patients on stable regimens of antiepileptic drugs (AEDs) requiring intermittent use of diazepam to control episodes of increased seizure activity

Use: Unlabeled/InvestigationalPanic disorders; preoperative sedation, light anesthesia, amnesia

Use: DentalOral medication for preoperative dental anxiety; sedative component in I.V. conscious sedation in oral surgery patients; skeletal muscle relaxant

Dosing: Adults**Note:** Oral absorption is more reliable than I.M.

Acute ethanol withdrawal:*Oral:* 10 mg 3-4 times during first 24 hours, then decrease to 5 mg 3-4 times/day as needed

Anticonvulsant (acute treatment):*Rectal gel:* 0.2 mg/kg. **Note:** Dosage should be rounded upward to the next available dose, 2.5, 5, 7.5, 10, 12.5, 15, 17.5, and 20 mg/dose; dose may be repeated in 4-12 hours if needed; do not use for more than 5 episodes per month or more than one episode every 5 days.

Anxiety (symptoms/disorders):

Oral: 2-10 mg 2-4 times/day

I.M., I.V.: 2-10 mg, may repeat in 3-4 hours if needed

Muscle spasm:*I.V., I.M.:* Initial: 5-10 mg; then 5-10 mg in 3-4 hours, if necessary. Larger doses may be required if associated with tetanus.

Sedation in the ICU patient:*I.V.:* 0.03-0.1 mg/kg every 30 minutes to 6 hours

Skeletal muscle relaxant (adjunct therapy):*Oral:* 2-10 mg 3-4 times/day

Status epilepticus:

I.V.: 5-10 mg every 5-10 minutes given over ≤5 mg/minute (maximum dose: 30 mg)

Rectal gel: Premonitory/out-of-hospital treatment: 10 mg once; may repeat once if necessary

Rapid tranquilization of agitated patient (administer every 30-60 minutes): *Oral:* 5-10 mg; average total dose for tranquilization: 20-60 mg

Dosing: Elderly**Oral absorption is more reliable than I.M.**. Elderly and/or debilitated patients:

Oral: 2-2.5 mg 1-2 times/day initially; increase gradually as needed and tolerated.

Rectal gel: Due to the increased half-life in elderly and debilitated patients, consider reducing dose.

Dosing: Pediatric

Anticonvulsant (acute treatment):*Rectal gel:*

Children <2 years: Safety and efficacy have not been studied

Children 2-5 years: 0.5 mg/kg

Children 6-11 years: 0.3 mg/kg

Children ≥12 years: Refer to adult dosing.

Note: Dosage should be rounded upward to the next available dose, 2.5, 5, 7.5, 10, 12.5, 15, 17.5, and 20 mg/dose; dose may be repeated in 4-12 hours if needed; do not use for more than 5 episodes per month or more than one episode every 5 days.

Conscious sedation for procedures:

Oral:

Children: 0.2-0.3 mg/kg (maximum dose: 10 mg) 45-60 minutes prior to procedure

Adolescents: 10 mg

I.V.: Adolescents: 5 mg; may repeat with 2.5 mg if needed

Febrile seizure prophylaxis:*Oral:* Children: 1 mg/kg/day divided every 8 hours; initiate therapy at first sign of fever and continue for 24 hours after fever is gone

Muscle spasm associated with tetanus:*I.V., I.M.:*

Infants >30 days: 1-2 mg/dose every 3-4 hours as needed

Children ≥5 years: 5-10 mg/dose every 3-4 hours as needed

Sedation or muscle relaxation or anxiety:

Oral: Children: 0.12-0.8 mg/kg/day in divided doses every 6-8 hours

I.M., I.V.: Children: 0.04-0.3 mg/kg/dose every 2-4 hours to a maximum of 0.6 mg/kg within an 8-hour period if needed

Status epilepticus:

I.V.: Infants >30 days and Children: 0.1-0.3 mg/kg given over ≤5 mg/minute; may repeat dose after 5-10 minutes; maximum: 10 mg/dose (Hegenbarth, 2008)

Rectal: 0.5 mg/kg/dose then 0.25 mg/kg/dose in 10 minutes if needed (prepare dose using parenteral formulation)

Dosing: Renal ImpairmentNo dose adjustment recommended; decrease dose if administered for prolonged periods.

I.V.: Risk of propylene glycol toxicity; monitor closely if using for prolonged periods or at high doses.

Hemodialysis: Not dialyzable (0% to 5%); supplemental dose is not necessary.

Dosing: Hepatic ImpairmentUse caution.

Administration: I.V.Continuous infusion is not recommended because of precipitation in I.V. fluids and absorption of drug into infusion bags and tubing. In children, do not exceed 1-2 mg/minute IVP; in adults 5 mg/minute.

Administration: I.V. DetailpH: 6.2-6.9

Administration: OralIntensol® should be diluted before use.

Administration: OtherRectal gel: Prior to administration, confirm that prescribed dose is visible and correct, and that the green “ready” band is visible. Patient should be positioned on side (facing person responsible for monitoring), with top leg bent forward. Insert rectal tip (lubricated) into rectum and push in plunger gently over 3 seconds. Remove tip of rectal syringe after 3 additional seconds. Buttocks should be held together for 3 seconds after removal. Dispose of syringe appropriately.

Storage

Injection: Store at 20° to 25°C (68° to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light. Potency is retained for up to 3 months when kept at room temperature. Most stable at pH 4-8; hydrolysis occurs at pH <3.

Rectal gel: Store at 25°C (77°F); excursion permitted to 15°C to 30°C (59°F to 86°F).

Tablet: Store at 15°C to 30°C (59°F to 86°F).

ReconstitutionPer manufacturer, do not mix I.V. product with other medications.

CompatibilityPer manufacturer, do not mix I.V. product with other medications. **Variable stability (consult detailed reference)** in D_5W, LR, NS.

Y-site administration: Compatible: Dobutamine, fentanyl, morphine sulfate, nafcillin, quinidine gluconate, sufentanil. **Incompatible:** Amphotericin B cholesteryl sulfate complex, atracurium, cefepime, dexmedetomidine, diltiazem, fluconazole, foscarnet, gatifloxacin, heparin, heparin with hydrocortisone sodium succinate, hetastarch, hydromorphone, linezolid, meropenem, pancuronium, potassium chloride, propofol, vecuronium, vitamin B complex with C. **Variable (consult detailed reference):** Cisatracurium, remifentanil.

Compatibility in syringe: Compatible: Cimetidine. **Incompatible:** Doxapram, glycopyrrolate, heparin, hydromorphone, nalbuphine, sufentanil. **Variable (consult detailed reference):** Ketorolac, ranitidine.

Compatibility when admixed: Compatible: Verapamil. **Incompatible:** Bleomycin, buprenorphine, dobutamine, doxorubicin, floxacillin, fluorouracil, furosemide.

RestrictionsC-IV

ContraindicationsHypersensitivity to diazepam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); myasthenia gravis; severe respiratory insufficiency; severe hepatic insufficiency; sleep apnea syndrome; acute narrow-angle glaucoma; not for use in children <6 months of age (oral)

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Psychiatric and paradoxical reactions: Reactions, including hyperactive or aggressive behavior, hallucinations, and psychoses, have been reported with benzodiazepines, particularly in adolescent/pediatric or elderly patients. Diazepam should be discontinued if reactions occur.

Disease-related concerns:

- Convulsive disorders: When used as an adjunct in treating convulsive disorders, an increase in frequency/severity of grand mal seizures may occur and require dose adjustment of anticonvulsant. Abrupt withdrawal may result in a temporary increase of seizures.

- Depression: Use caution in patients with depression or anxiety associated with depression, particularly if suicidal risk may be present.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use (generally >10 days).

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease; a lower dose is recommended for chronic respiratory insufficiency.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 and CYP2C19 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Narcotics: The dosage of narcotics should be reduced by approximately one-third when diazepam is added.

Special populations:

- Debilitated/elderly patients: Use with caution; active metabolites with extended half-lives may lead to delayed accumulation and adverse effects; limit dose to smallest effective amount (2-2.5 mg once or twice daily initially, to be increased gradually and as tolerated) to avoid adverse reactions.

- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

- Neonates: Safety and efficacy of the injection have not been established in children <1 month of age. Solution for injection may contain sodium benzoate, benzyl alcohol, or benzoic acid. Large amounts have been associated with “gasping syndrome” in neonates.

- Obese patients: Use with caution in obese patients; may have prolonged action when discontinued.

- Pediatrics: Safety and efficacy of oral use have not been established in children <6 months of age. Safety and efficacy in rectal gel have not been established in children <2 years of age.

- Psychotic patients: Use of diazepam is not recommended in place of appropriate therapy.

Dosage form specific issues:

- Parenteral: Acute hypotension, muscle weakness, apnea, and cardiac arrest have occurred with parenteral administration. Acute effects may be more prevalent in patients receiving concurrent barbiturates, narcotics, or ethanol. Appropriate resuscitative equipment and qualified personnel should be available during administration and monitoring. Avoid use of the injection in patients with shock, coma, or acute ethanol intoxication. Intra-arterial injection or extravasation of the parenteral formulation should be avoided. Parenteral formulation contains propylene glycol, which has been associated with toxicity when administered in high dosages.

- Propylene glycol: Parenteral formulation contains propylene glycol. May be associated with toxicity in high-dose and/or longer-term therapy.

- Rectal gel: Administration of rectal gel should only be performed by individuals trained to recognize characteristic seizure activity for which the product is indicated, and capable of monitoring response to determine need for additional medical intervention.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.

- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsDue to its long-acting metabolite, diazepam is not considered a drug of choice in the elderly. Long-acting benzodiazepines have been associated with falls in the elderly. Interpretive guidelines from the Centers for Medicare and Medicaid Services (CMS) strongly discourage the use of this agent in residents of long-term care facilities.

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects have been reported in animal studies. In humans, diazepam crosses the placenta. An increased risk of congenital malformations and other developmental abnormalities have been associated with diazepam; epilepsy itself may also increase the risk. Hypotonia, hypothermia, withdrawal symptoms, respiratory and feeding difficulties have been reported in the infant following maternal use of benzodiazepines near time of delivery.

LactationEnters breast milk/contraindicated (AAP rates “of concern”)

Breast-Feeding ConsiderationsClinical effects on the infant include sedation; AAP reports that USE MAY BE OF CONCERN.

Adverse ReactionsFrequency not defined. Adverse reactions may vary by route of administration.

Cardiovascular: Hypotension, vasodilatation

Central nervous system: Amnesia, ataxia, confusion, depression, drowsiness, fatigue, headache, slurred speech, paradoxical reactions (eg, aggressiveness, agitation, anxiety, delusions, hallucinations, inappropriate behavior, increased muscle spasms, insomnia, irritability, psychoses, rage, restlessness, sleep disturbances, stimulation), vertigo

Dermatologic: Rash

Endocrine & metabolic: Libido changes

Gastrointestinal: Constipation, diarrhea, nausea, salivation changes (dry mouth or hypersalivation)

Genitourinary: Incontinence, urinary retention

Hepatic: Jaundice

Local: Phlebitis, pain with injection

Neuromuscular & skeletal: Dysarthria, tremor, weakness

Ocular: Blurred vision, diplopia

Respiratory: Apnea, asthma, respiratory rate decreased

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2B6 (minor), 2C9 (minor), 2C19 (major), 3A4 (major); **Inhibits** CYP2C19 (weak), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Diazepam serum levels may be increased if taken with food. Diazepam effect/toxicity may be increased by grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: St John's wort may decrease diazepam levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsFalse-negative urinary glucose determinations when using Clinistix® or Diastix®

Monitoring ParametersRespiratory, cardiovascular, and mental status; check for orthostasis

Reference RangeTherapeutic: Diazepam: 0.2-1.5 mcg/mL (SI: 0.7-5.3 µmol/L); N-desmethyldiazepam (nordiazepam): 0.1-0.5 mcg/mL (SI: 0.35-1.8 µmol/L)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. Monitor blood pressure, CNS status. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient seizure precautions (if administered for seizures), appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help). If medication is used to control seizures, wear identification that you are taking an antiepileptic medication. Report CNS changes (confusion, depression, increased sedation, excitation, headache, agitation, insomnia or nightmares, dizziness, fatigue, or impaired coordination) or changes in cognition; respiratory difficulty or shortness of breath; changes in urinary pattern; changes in sexual activity; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances; excessive perspiration; excessive GI symptoms (cramping, constipation, vomiting, anorexia); or worsening of seizure activity or loss of seizure control. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, rectal:

Diastat®: Pediatric rectal tip [4.4 cm]: 5 mg/mL (2.5 mg, 5 mg) [contains ethyl alcohol 10%, sodium benzoate, benzyl alcohol 1.5%; twin pack]

Diastat® AcuDial™ delivery system:

10 mg: Pediatric/adult rectal tip [4.4 cm]: 5 mg/mL (delivers set doses of 5 mg, 7.5 mg, and 10 mg) [contains ethyl alcohol 10%, sodium benzoate, benzyl alcohol 1.5%; twin pack]

20 mg: Adult rectal tip [6 cm]: 5 mg/mL (delivers set doses of 10 mg, 12.5 mg, 15 mg, 17.5 mg, and 20 mg) [contains ethyl alcohol 10%, sodium benzoate, benzyl alcohol 1.5%; twin pack]

Injection, solution: 5 mg/mL (2 mL, 10 mL)

Solution, oral: 5 mg/5 mL (5 mL, 500 mL)

Solution, oral concentrate:

Diazepam Intensol®: 5 mg/mL (30 mL)

Tablet: 2 mg, 5 mg, 10 mg

Valium®: 2 mg, 5 mg, 10 mg

Generic AvailableYes: Injection, tablet, solution only

Pricing: U.S. (www.drugstore.com)

Gel (Diastat AcuDial)

10 mg (1): $384.99

Gel (Diastat Universal)

10 mg (1): $211.99

Tablets (Diazepam)

2 mg (30): $11.99

5 mg (30): $11.99

10 mg (30): $12.99

Tablets (Valium)

2 mg (30): $54.04

5 mg (30): $81.64

10 mg (30): $121.89

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

I.V.: Status epilepticus:

Onset of action: Almost immediate

Duration: 20-30 minutes

Absorption: Oral: 85% to 100%, more reliable than I.M.

Protein binding: 98%

Metabolism: Hepatic

Half-life elimination: Parent drug: Adults: 20-50 hours; increased half-life in neonates, elderly, and those with severe hepatic disorders; Active major metabolite (desmethyldiazepam): 50-100 hours; may be prolonged in neonates

Pharmacotherapy PearlsDiazepam does not have any analgesic effects.

Diastat® AcuDial™: When dispensing, consult package information for directions on setting patient's dose; confirm green "ready" band is visible prior to dispensing product.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Diazepam is a long half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism.

Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Diazepam is the most rapidly absorbed benzodiazepine; poorly and erratically absorbed after I.M. administration; undergoes phase I metabolism; injection contains propylene glycol which may cause hypotension and bradycardia when injected rapidly. Therefore, maximum rate of infusion is 5 mg/minute.

Cardiovascular ConsiderationsHypotension may result in orthostatic lightheadedness or syncope. Benzodiazepines, as a class, may depress respiration. These medications may often be prescribed for difficulty in sleeping but may exacerbate sleep-disordered breathing.

Anesthesia and Critical Care Concerns/Other ConsiderationsOral absorption more reliable than intramuscular. Intensol® should be diluted before use. Diazepam does not have any analgesic effects. Chronic use of this agent may increase the perioperative benzodiazepine dose needed to achieve desired effect. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms. Hypotension may result in orthostatic lightheadedness or syncope. Benzodiazepines, as a class, may depress respiration. The 2002 ACCM/SCCM guidelines for the sustained use of sedatives and analgesics in critically-ill adults recommend diazepam or midazolam for rapid sedation of acutely-agitated patients.

Status Epilepticus: A randomized, double-blind trial (Treiman, 1998) evaluated the efficacy of four treatments in overt status epilepticus. Treatment arms were designed based upon accepted practices of North American neurologists. The treatments were: 1) lorazepam 0.1 mg/kg, 2) diazepam 0.15 mg/kg followed by phenytoin 18 mg/kg, 3) phenytoin 18 mg/kg alone, and 4) phenobarbital 15 mg/kg. Treatment was considered successful if the seizures were terminated (clinically and by EEG) within 20 minutes of start of therapy without seizure recurrence within 60 minutes from the start of therapy. Patients who failed the first treatment received a second and a third, if necessary. Patients did not receive randomized treatments after the first one but the treating physician remained blinded. Treatment success: Lorazepam 64.9%, phenobarbital 58.2%, diazepam/phenytoin 55.8%, and phenytoin alone 43.6%. Using an “intention-to-treat” analysis, there was no statistical difference between the groups. Results of subsequent treatments in patients who failed the first therapy indicated that response rate significantly dropped regardless of treatment. Aggregate response rate to the second treatment was 7.0% and third treatment 2.3%.

Guidelines are available for status epilepticus (Kälviäinen, 2007).

Diazoxide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Diazoxide may be confused with diazepam, Dyazide®

Pronunciation(dye az OKS ide)
U.S. Brand NamesProglycem®
Canadian Brand NamesProglycem®
Pharmacologic CategoryAntidote, Hypoglycemia; Vasodilator, Direct-Acting
Use: Labeled IndicationsHypoglycemia related to islet cell adenoma, carcinoma, hyperplasia, or adenomatosis; nesidioblastosis; leucine sensitivity; extrapancreatic malignancy
Dosing: Adults**Hyperinsulinemic hypoglycemia:** Oral: Initial dose: 3 mg/kg/day; dosing range: 3-8 mg/kg/day in divided doses every 8-12 hours. **Note:** In certain instances, patients with refractory hypoglycemia may require higher doses.
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Hyperinsulinemic hypoglycemia:** Oral:

Newborns and Infants: Initial dose: 10 mg/kg/day; dosing range: 8-15 mg/kg/day in divided doses every 8-12 hours

Children: Refer to adult dosing.

Dosing: Renal ImpairmentHalf-life may be prolonged with renal impairment; a reduced dose should be considered.
StorageSuspension: Store at controlled room temperature of 25°C (77°F). Protect from light.
ContraindicationsHypersensitivity to diazoxide, thiazides, or other sulfonamide derivatives; functional hypoglycemia
Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Disease-related concerns:

- Heart failure: Use may lead to increased fluid retention and may precipitate congestive heart failure in patients with compromised cardiac reserve.
- Gout: Use with caution in patients with hyperuricemia or a history of gout.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; a reduced dose should be considered.

Concerns related to adverse effects:

- Hyperosmolar coma: Nonketotic hyperosmolar coma may occur during treatment; usually in patients with concomitant illness. Transient cataracts have been reported which subside following correction of hyperosmolarity.
- Ketoacidosis: Ketoacidosis may occur during treatment, usually in patients with concomitant illness.

Special populations:

- Newborns: May displace bilirubin from albumin; use caution in newborns with hyperbilirubinemia.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAdverse events have been observed in animal studies. Diazoxide crosses the human placenta. Altered carbohydrate metabolism, hyperbilirubinemia, or thrombocytopenia have been reported in the fetus or neonate. Alopecia and hypertrichosis lanuginosa have also been reported in infants following maternal use of diazoxide during the last 19-60 days of pregnancy.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, palpitation, tachycardia

Central nervous system: Anxiety, dizziness, fever, headache, insomnia, malaise, polyneuritis

Dermatologic: Hirsutism, pruritus, purpura, rash, scalp hair loss

Endocrine & metabolic: Breast lump enlargement, diabetic ketoacidosis, fluid retention, galactorrhea, gout, hyperglycemia, hyperosmolar nonketotic coma, sodium retention

Gastrointestinal: Abdominal pain, anorexia, diarrhea, ileus, nausea, pancreatitis, pancreatic necrosis, taste loss (transient), vomiting

Hematologic: Bleeding (excessive), eosinophilia, hemoglobin/hematocrit decreased, neutropenia (transient), thrombocytopenia

Hepatic: Alkaline phosphatase increased, AST increased

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, cataracts (transient), diplopia, lacrimation, ring scotoma, subconjunctival hemorrhage

Renal: Albuminuria, azotemia, creatinine clearance decreased, glucosuria, hematuria, nephrotic syndrome (reversible), uric acid increased, urinary output decreased

Miscellaneous: Abnormal facial features (children with chronic use), IgG decreased, lymphadenopathy

Drug Interactions

Antihypertensives: Diazoxide may enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Phenytoin: Diazoxide may decrease the serum concentration of Phenytoin. Total phenytoin concentrations may be affected more than free phenytoin concentrations. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid herbs with hypotensive properties (black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse); may enhance the hypotensive effect of diazoxide. Avoid herbs with hypertensive properties (bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng [American], kola, licorice); may diminish the antihypertensive effect of diazoxide.

Test InteractionsFalse-negative insulin response to glucagon

Monitoring ParametersBlood glucose, serum uric acid, BUN, creatinine clearance, CBC with differential, AST; urine glucose and ketones

Monitoring: Lab TestsBlood glucose, serum uric acid, BUN, creatinine clearance, CBC with differential, AST; urine glucose and ketones

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, oral:

Proglycem®: 50 mg [not available in the U.S.]

Suspension, oral:

Proglycem®: 50 mg/mL (30 mL) [contains ethanol 7.25%, sodium benzoate, propylene glycol; chocolate-mint flavor]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Suspension (Proglycem)

50 mg/mL (30): $154.43

Mechanism of ActionActivates potassium channels. Inhibits insulin release from the pancreas

Pharmacodynamics/Kinetics

Onset of action: Hyperglycemic: Oral: ~1 hour

Duration: Hyperglycemic: Oral: Normal renal function: 8 hours

Protein binding: >90%

Half-life elimination: Oral: Children: 9-24 hours; Adults: 24-36 hours

Excretion: Urine

Related Information

- Hypertension

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; may rarely cause extrapyramidal symptoms

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine

Jump To Field (Select Field Name)

Pronunciation(DYE byoo kane)

U.S. Brand NamesNupercainal® [OTC]

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsFast, temporary relief of pain and itching due to hemorrhoids, minor burns

Use: DentalAmide derivative local anesthetic for minor skin conditions

Dosing: AdultsLocal pain (local anesthetic): Topical: Apply gently to the affected areas; no more than 30 g for adults or 7.5 g for children should be used in any 24-hour period

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren: Topical: Refer to adult dosing.

StorageDarkens on light exposure.

ContraindicationsHypersensitivity to amide-type anesthetics, ophthalmic use

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Pregnancy Risk FactorC

Breast-Feeding ConsiderationsNo data reported; however, topical administration is probably compatible.

Adverse Reactions1% to 10%:

Dermatologic: Angioedema, contact dermatitis

Local: Burning

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ointment, topical: 1% (30 g)

Nupercainal®: 1% (30 g, 60g) [contains sodium bisulfite]

Generic AvailableYes

Mechanism of ActionLocal anesthetics bind selectively to the intracellular surface of sodium channels to block influx of sodium into the axon. As a result, depolarization necessary for action potential propagation and subsequent nerve function is prevented. The block at the sodium channel is reversible. When drug diffuses away from the axon, sodium channel function is restored and nerve propagation returns.

Pharmacodynamics/Kinetics

Onset of action: ~15 minutes

Duration: 2-4 hours

Absorption: Poor through intact skin; well absorbed through mucous membranes and excoriated skin

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Dichlorodifluoromethane and Trichloromonofluoromethane

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(dye klor oh dye flor oh METH ane & tri klor oh mon oh flor oh METH ane)

U.S. Brand NamesFluori-Methane®

Pharmacologic CategoryAnalgesic, Topical

Use: Labeled IndicationsManagement of pain associated with injections

Use: DentalTopical application in the management of myofascial pain, restricted motion, and muscle spasm

Dosing: AdultsMyofascial pain, muscle spasm, pain associated with injections: Topical: Invert bottle over treatment area approximately 12" away from site of application; open dispenseal spring valve completely, allowing liquid to flow in a stream from the bottle. The rate of spraying is approximately 10 cm/second and should be continued until entire muscle has been covered.

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to dichlorofluoromethane and/or trichloromonofluoromethane, or any component of the formulation; patients having vascular impairment of the extremities

Warnings/Precautions

Other warnings/precautions:

- Appropriate use: For external use only; care should be taken to minimize inhalation of vapors, especially with application to head and neck; avoid contact with eyes; should not be applied to the point of frost formation.

Adverse ReactionsNo data reported.

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol, topical: Dichlorodifluoromethane 15% and trichloromonofluoromethane 85% (103 mL) [contains chlorofluorocarbons]

Generic AvailableNo

Pharmacodynamics/KineticsNo data reported

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsTrichloromonofluoromethane and Dichlorodifluoromethane

Medication Safety Issues

Sound-alike/look-alike issues:

Daranide® may be confused with Daraprim®

Pronunciation(dye klor FEN a mide)

U.S. Brand NamesDaranide®

Canadian Brand NamesDaranide®

Pharmacologic CategoryCarbonic Anhydrase Inhibitor; Diuretic, Carbonic Anhydrase Inhibitor; Ophthalmic Agent, Antiglaucoma

Use: Labeled IndicationsAdjunct in treatment of open-angle glaucoma and perioperative treatment for angle-closure glaucoma

Dosing: AdultsGlaucoma: Oral: 100-200 mg to start followed by 100 mg every 12 hours until desired response is obtained; maintenance dose: 25-50 mg 1-3 times/day

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to dichlorphenamide or any component of the formulation; severe pulmonary obstruction; severe renal impairment

Allergy Considerations

- Carbonic Anhydrase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonylurea allergy is specifically contraindicated in product labeling; however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Geriatric ConsiderationsMalaise, complaints of tiredness, and myalgia are signs of excessive dosing and acidosis in the elderly.

Pregnancy Risk FactorC

Adverse Reactions

>10%:

Central nervous system: Fatigue, malaise

Gastrointestinal: Anorexia, diarrhea, metallic taste

Genitourinary: Polyuria

1% to 10%:

Central nervous system: Drowsiness, mental depression

Renal: Renal calculi

Drug Interactions

Alpha-/Beta-Agonists: Carbonic Anhydrase Inhibitors may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amphetamines: Carbonic Anhydrase Inhibitors may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Barbiturate): Carbonic Anhydrase Inhibitors may enhance the adverse/toxic effect of Anticonvulsants (Barbiturate). Specifically, osteomalacia and rickets. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Carbonic Anhydrase Inhibitors may enhance the adverse/toxic effect of Anticonvulsants (Hydantoin). Specifically, osteomalacia and rickets. *Risk C: Monitor therapy*

CarBAMazepine: Carbonic Anhydrase Inhibitors may increase the serum concentration of CarBAMazepine. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Flecainide: Carbonic Anhydrase Inhibitors may decrease the excretion of Flecainide. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Memantine: Carbonic Anhydrase Inhibitors may decrease the excretion of Memantine. *Risk C: Monitor therapy*

Methenamine: Carbonic Anhydrase Inhibitors may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Primidone: Carbonic Anhydrase Inhibitors may enhance the adverse/toxic effect of Primidone. Specifically, osteomalacia and rickets. Carbonic Anhydrase Inhibitors may decrease the serum concentration of Primidone. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Carbonic Anhydrase Inhibitors may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Trientine: Carbonic Anhydrase Inhibitor Diuretics may decrease the serum concentration of Trientine. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 50 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Daranide)

50 mg (30): $20.99

Related Information

- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause bone marrow suppression; use caution with clozapine and carbamazepine; may increase the excretion of lithium but should not be used to treat lithium toxicity

Index TermsDiclofenamide

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(dye KLOE fen ak & mye soe PROST ole)

U.S. Brand NamesArthrotec®

Canadian Brand NamesArthrotec®

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral; Prostaglandin

Use: Labeled IndicationsThe diclofenac component is indicated for the treatment of osteoarthritis and rheumatoid arthritis; the misoprostol component is indicated for the prophylaxis of NSAID-induced gastric and duodenal ulceration

Dosing: Adults

Osteoarthritis: Oral: Arthrotec® 50: 1 tablet 2-3 times/day

Rheumatoid arthritis: Oral: Arthrotec® 50: 1 tablet 3-4 times/day

> **Note:** For both regimens, if not tolerated by patient, the dose may be reduced to 1 tablet twice daily. Arthrotec® 75 may be used in patients who cannot tolerate full daily Arthrotec® 50 regimens. Dose: 1 tablet twice daily. However, the use of these tablets may not be as effective at preventing GI ulceration.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot recommended for use in patients with advanced renal disease. In renal insufficiency, diclofenac should be used with caution due to potential detrimental effects on renal function, and misoprostol dosage reduction may be required if adverse effects occur (misoprostol is renally eliminated).

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to diclofenac, misoprostol, other prostaglandins, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery; pregnancy

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.
- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to

reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Porphyria: Avoid use in patients with hepatic porphyria.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Misoprostol is not to be used in pregnant women or women of childbearing potential unless capable of complying with effective contraceptive measures; therapy is normally begun on the second or third day of next normal menstrual period.** Uterine perforation and/or rupture have been reported in association with intravaginal use to induce labor or with combined oral/intravaginal use to induce abortion. Should not be used as a cervical-ripening agent for induction of labor or termination of pregnancy.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from nonsteroidal anti-inflammatory agents. As much as 60% of the elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorX

Pregnancy Considerations**[U.S. Boxed Warning]: Exposure to NSAIDs late in pregnancy may lead to premature closure of the ductus arteriosus and may inhibit uterine contractions. Misoprostol is an abortifacient. Administration by any route is contraindicated in pregnancy.** Reports of fetal death and congenital anomalies have been received after the use of misoprostol as an abortifacient. Arthrotec® should not be used in women of childbearing potential without a negative serum pregnancy test within 2 weeks prior to therapy and unless capable of complying with effective contraception. Therapy should begin on the 2nd or 3rd day of the next normal menstrual period. Written and verbal warnings concerning the hazards of misoprostol should be provided. Pregnancy should be avoid for one month or through one complete menstrual cycle after therapy is discontinued.

LactationEnters breast milk/not recommended

Adverse ReactionsAlso see individual agents.

>10%: Gastrointestinal: Abdominal pain (21%), diarrhea (19%), dyspepsia (14%), nausea (11%)

1% to 10%:

Endocrine & metabolic: Transaminases increased

Gastrointestinal: Flatulence (9%)

Hematologic: Anemia

Miscellaneous: Anaphylactic reactions

Postmarketing and/or case reports (associated with misoprostol): Uterine rupture, fetal or infant death (when used during pregnancy)

Metabolism/Transport EffectsDiclofenac: **Substrate** (minor) of CYP1A2, 2B6, 2C8, 2C9, 2C19, 2D6, 3A4; **Inhibits** CYP1A2 (moderate), 2C9 (weak), 2E1 (weak), 3A4 (weak)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Latanoprost: NSAID (Ophthalmic) may diminish the therapeutic effect of Latanoprost. *Risk C: Monitor therapy*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Oxytocin: Misoprostol may enhance the therapeutic effect of Oxytocin. *Risk D: Consider therapy modification*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: May increase the serum concentration of Diclofenac. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Diclofenac sodium 50 mg and misoprostol 200 mcg; diclofenac sodium 75 mg and misoprostol 200 mcg

Generic AvailableNo

ManufacturerSearle

Pricing: U.S. (www.drugstore.com)

Related Information

- Diclofenac
- Misoprostol

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness or dizziness; may rarely cause depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause may agranulocytosis; use caution with clozapine and carbamazepine; may decrease the clearance of lithium resulting in elevated serum levels and potential toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Index TermsMisoprostol and Diclofenac

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Diclofenac may be confused with Diflucan®, Duphalac®

Cataflam® may be confused with Catapres®

Voltaren® may be confused with traMADol, Ultram®, Verelan®

Pronunciation(dye KLOE fen ak)

U.S. Brand NamesCataflam®; Flector®; Solaraze®; Voltaren Ophthalmic®; Voltaren®; Voltaren® Gel; Voltaren®-XR

Canadian Brand NamesApo-Diclo Rapide®; Apo-Diclo SR®; Apo-Diclo®; Cataflam®; Dom-Diclofenac; Dom-Diclofenac SR; Novo-Difenac; Novo-Difenac K; Novo-Difenac-SR; Nu-Diclo; Nu-Diclo-SR; Pennsaid®; PMS-Diclofenac; PMS-Diclofenac SR; Pro-Diclo-Rapide; Riva-Diclofenac; Riva-Diclofenac-K; Sab-Diclofenac; Sandoz-Diclofenac; Voltaren Ophtha®; Voltaren Rapide®; Voltaren®

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID); Nonsteroidal Anti-inflammatory Drug (NSAID), Ophthalmic; Nonsteroidal Anti-inflammatory Drug (NSAID), Oral; Nonsteroidal Anti-inflammatory Drug (NSAID), Topical

Use: Labeled Indications

Immediate release tablet: Ankylosing spondylitis; primary dysmenorrhea; acute and chronic treatment of rheumatoid arthritis, osteoarthritis

Delayed-release tablet: Acute and chronic treatment of rheumatoid arthritis, osteoarthritis, ankylosing spondylitis

Extended-release tablet: Chronic treatment of osteoarthritis, rheumatoid arthritis

Ophthalmic solution: Postoperative inflammation following cataract extraction; temporary relief of pain and photophobia in patients undergoing corneal refractive surgery

Topical gel 1%: Relief of osteoarthritis pain in joints amenable to topical therapy (eg, ankle, elbow, foot, hand, knee, wrist)

Topical gel 3%: Actinic keratosis (AK) in conjunction with sun avoidance

Topical patch: Acute pain due to minor strains, sprains, and contusions

Use: Unlabeled/InvestigationalJuvenile rheumatoid arthritis

Use: DentalImmediate-release tablets: Acute treatment of mild to moderate pain

Dosing: Adults

Analgesia/primary dysmenorrhea: Oral: Starting dose: 50 mg 3 times/day; maximum dose: 150 mg/day

Rheumatoid arthritis: Oral: 150-200 mg/day in 2-4 divided doses (100 mg/day of sustained release product)

Osteoarthritis:

Oral: 100-150 mg/day in 2-3 divided doses (100-200 mg/day of sustained release product)

Topical (Voltaren® Gel): **Note:** Maximum total body dose of 1% gel should not exceed 32 g per day

Lower extremities: Apply 4 g of 1% gel to affected area 4 times daily (maximum: 16 g per joint per day)

Upper extremities: Apply 2 g of 1% gel to affected area 4 times daily (maximum: 8 g per joint per day)

Ankylosing spondylitis: Oral: 100-125 mg/day in 4-5 divided doses

Cataract surgery: Ophthalmic: Instill 1 drop into affected eye 4 times/day beginning 24 hours after cataract surgery and continuing for 2 weeks

Corneal refractive surgery: Ophthalmic: Instill 1-2 drops into affected eye within the hour prior to surgery, within 15 minutes following surgery, and then continue for 4 times/day, up to 3 days

Actinic keratosis (AK): Topical (Solaraze® Gel): Apply 3% gel to lesion area twice daily for 60-90 days

Acute pain (strains, sprains, contusions): Topical (patch): Apply 1 patch twice daily to most painful area of skin

Dosing: ElderlyRefer to adult dosing. No specific dosing recommendations; elderly may demonstrate adverse effects at lower doses than younger adults, and >60% may develop asymptomatic peptic ulceration with or without hemorrhage; monitor renal function.

Dosing: Renal ImpairmentNot recommended in patients with advanced renal disease or significant renal impairment.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: OralDo not crush tablets. Administer with food or milk to avoid gastric distress. Take with full glass of water to enhance absorption.

Administration: Topical

Topical gel:

1% formulation: Apply gel to affected joint and rub into skin gently, making sure to apply to entire joint. Do not cover area with occlusive dressings or apply sunscreens, cosmetics, or other medications to affected area. Do not wash area for one hour following application. Wash hands immediately after application (unless hands are treated joint).

3% formulation: Apply to lesion with gel and smooth into skin gently. Do not cover lesion with occlusive dressings or apply sunscreens, cosmetics, or other medications to affected area.

Topical patch: Apply to intact, nondamaged skin. Remove transparent liner prior to applying to skin. Wash hands after applying as well as after removal of patch. May tape down edges of patch, if peeling occurs. Should not be worn while bathing or showering. Fold used patches so the adhesive side sticks to itself; dispose of used patches out of reach of children and pets.

Administration: OtherOphthalmic: Wait at least 5 minutes before administering other types of eye drops.

Dietary ConsiderationsOral formulations may be taken with food to decrease GI distress.

Diclofenac potassium = Cataflam®; potassium content: 5.8 mg (0.15 mEq) per 50 mg tablet

Storage

Ophthalmic solution: Store at 15°C to 25°C (59°F to 77°F).

Tablet: Store below 30°C (86°F). Protect from moisture; store in tight container.

Topical gel: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F); do not freeze.

Topical patch: Store at controlled room temperature 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Keep envelope sealed when not being used.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to diclofenac, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Topical patch: Do not apply to nonintact or damaged skin (eg, exudative dermatitis, eczema, infected lesions, burns or wounds)

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, HF, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery (CABG): **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Rarely, severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use; discontinue all formulations if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics and ACEI, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, and renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Ophthalmic drops: Monitor patients for 1 year following application of ophthalmic drops for corneal refractive procedures. Patients using ophthalmic drops should not wear soft contact lenses. Ophthalmic drops may slow/delay healing or prolong bleeding time following surgery.

- Topical gel: Do not apply topical gel to the eyes, mucous membranes, open wounds, infected areas, or to exfoliative dermatitis. Avoid use of occlusive dressings. Should not be used concomitantly with sunscreens, cosmetics, lotions, moisturizers, insect repellents, or other topical medication on the same skin sites. Avoid sunlight exposure to treated areas.

- Topical patch: Do not apply topical patch to the eyes, mucous membranes, open wounds, infected areas, or to exudative dermatitis. Patch should not be worn during bathing or showering.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from nonsteroidal anti-inflammatory agents. As much as 60% of the elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorB (topical gel 3%); C (oral, topical gel 1%, topical patch); D (3rd trimester)

Pregnancy ConsiderationsSafety and efficacy in pregnant women have not been established. Exposure late in pregnancy may lead to premature closure of the ductus arteriosus and may inhibit uterine contractions. Avoid use of diclofenac (all forms) in late pregnancy.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

Ophthalmic solution (drops):

>10%: Ocular: Lacrimation (30%), keratitis (28%), intraocular pressure increased (15%), transient burning/stinging (15%)

1% to 10%:

Cardiovascular: Facial edema (≤3%)

Central nervous system: ≤3%: Dizziness, fever, headache, insomnia, pain

Gastrointestinal: ≤3%: Abdominal pain, nausea, vomiting

Neuromuscular & skeletal: ≤3%: Pain, weakness

Ocular: 5%: Abnormal vision, blurred vision, conjunctivitis, corneal deposits, corneal edema, corneal lesions, corneal opacity, discharge, eyelid swelling, injection, iritis, irritation, itching, lacrimation disorder, ocular allergy

Respiratory: Rhinitis (≤3%)

Miscellaneous: Viral infection (≤3%)

<1%, postmarketing, and/or case reports: Corneal erosion, corneal infiltrates, corneal perforation, corneal thinning, corneal ulceration, epithelial breakdown, superficial punctuate keratitis

Oral:

1% to 10%:

- Cardiovascular: Edema
- Central nervous system: Dizziness, headache
- Dermatologic: Pruritus, rash
- Endocrine & metabolic: Fluid retention
- Gastrointestinal: Abdominal distension, abdominal pain, constipation, diarrhea, dyspepsia, flatulence, GI perforation, heartburn, nausea, peptic ulcer/GI bleed, vomiting
- Hematologic: Anemia, bleeding time increased
- Hepatic: Liver enzyme abnormalities
- Otic: Tinnitus
- Renal: Renal function abnormal

<1%, postmarketing, and/or case reports: Abnormal coordination, agranulocytosis, alopecia, amblyopia, anaphylactoid reactions, anaphylaxis, anxiety, angioedema, aphthous stomatitis, aplastic anemia, appetite changes, arrhythmia, aseptic meningitis, asthma, azotemia, blurred vision, bruising, chest pain, cirrhosis, CHF, colitis, confusion, coma, cystitis, depression, dermatitis, diaphoresis, diplopia, disorientation, drowsiness, dyspnea, epistaxis, eructation, erythema multiforme, esophageal lesions, exfoliative dermatitis, dysuria, flushing, hallucination, hearing impairment, hearing loss, hematuria, hemoglobin decreased, hemolytic anemia, hepatitis, hepatic failure, hepatic necrosis, hyper-/hypotension, hyper-/hypoglycemia, hyperventilation, impotence, infection, interstitial nephritis, intestinal perforation, jaundice, laryngeal edema, leukopenia, lymphadenopathy, malaise, melena, memory disturbance, meningitis, MI, nervousness, night blindness, nocturia, oliguria, palpitation, pancreatitis, pancytopenia, paresthesia, pharynx edema, photosensitivity, pneumonia, polyuria, purpura, psychotic reactions, PVCs, rectal bleeding, renal failure, respiratory depression, scotoma, seizure, sepsis, somnolence, Stevens-Johnson syndrome, swelling of lips and tongue, stomatitis, syncope, tachycardia, taste disorder, thrombocytopenia, tic, toxic epidermal necrolysis, tremor, urinary frequency, urticaria, vaginal bleeding, vertigo, vitreous floaters, weight change, weakness, vasculitis, xerostomia

Topical gel:

>10%: Local: Application site reactions (incidence increased with 3% gel): Pruritus (≤52%), rash (35% to 46%), contact dermatitis (4% to 33%), dry skin (≤27%), pain (15% to 26%), exfoliation (3% gel; 6% to 24%), paresthesia (≤20%)

1% to 10% (reported for 3% gel):

- Cardiovascular: Chest pain, hypertension
- Central nervous system: Headache, pain
- Dermatologic: Pruritus, rash, skin ulcer
- Endocrine & metabolic: Hypercholesterolemia, hyperglycemia
- Gastrointestinal: Abdominal pain, diarrhea, dyspepsia
- Genitourinary: Hematuria
- Hepatic: Liver enzymes increased
- Local: Alopecia, edema, photosensitivity
- Neuromuscular and skeletal: Arthralgia, arthrosis, back pain, CPK increased, hypokinesia, myalgia, neck pain, weakness
- Ocular: Conjunctivitis
- Respiratory: Asthma, dyspnea, pneumonia, sinusitis
- Miscellaneous: Flu-like syndrome

Topical patch:

1% to 10%:

- Central nervous system: Dizziness, hypaesthesia
- Dermatologic: Dermatitis (2%), dermal allergic reaction
- Gastrointestinal: Nausea (3%), dysgeusia (2%), abdominal pain, constipation, diarrhea, gastritis, vomiting, xerostomia
- Local: Application site dryness, irritation, erythema, atrophy, discoloration, hyperhidrosis, and vesicles, edema, itching
- Neuromuscular & skeletal: Hyperkinesia

Metabolism/Transport Effects **Substrate** (minor) of CYP1A2, 2B6, 2C8, 2C9, 2C19, 2D6, 3A4; **Inhibits** CYP1A2 (moderate), 2C9 (weak), 2E1 (weak), 3A4 (weak)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Latanoprost: NSAID (Ophthalmic) may diminish the therapeutic effect of Latanoprost. *Risk C: Monitor therapy*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: May increase the serum concentration of Diclofenac. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, grapeseed, green tea, ginseng (Siberian), guggul, horse chestnut, horseradish, licorice, prickly ash, red clover, reishi, SAMe (s-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersMonitor CBC, liver enzymes; monitor urine output and BUN/serum creatinine; occult blood loss, hemoglobin, hematocrit

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess other medications patient may be taking for effectiveness and interactions. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (systemic or ophthalmic) at beginning of therapy and periodically throughout therapy. Schedule ophthalmic evaluations for patients who develop eye complaints during long-term NSAID therapy. Assess knowledge/teach patient appropriate use (oral, ophthalmic, gel), interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC, liver enzymes, urine output and BUN/serum creatinine in patients receiving diuretics, occult blood loss

Patient EducationOral: Take this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush or chew tablets. Take with 8 oz of water, along with food or milk products to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid alcohol, aspirin and aspirin-containing medication, or any other anti-inflammatory medications unless consulting prescriber. You may experience dizziness, nervousness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, dry mouth, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or constipation (increased exercise, fluids, fruit, or fiber may help). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report chest pain or palpitations; breathlessness or respiratory difficulty; unusual bruising/bleeding or blood in urine, stool, mouth, or vomitus; unusual fatigue; skin rash or itching; jaundice, unusual weight gain, or swelling of extremities; change in urinary pattern; change in vision or hearing (ringing in ears). **Pregnancy/breast-feeding precautions:** Consult prescriber if you are pregnant. This drug should not be used in the 3rd trimester of pregnancy. Consult prescriber if you are breast-feeding.

Ophthalmic: For ophthalmic use only. Apply prescribed amount as often as directed. Wash hands before using. Tilt head back and look upward. Gently pull down lower lid and put drop(s) in inner corner of eye. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Close eye and roll eyeball in all directions. Do not blink for $^1/_2$minute. Apply gentle pressure to inner corner of eye for 30 seconds. Wipe away excess from skin around eye. Do not use any other eye preparation for at least 10 minutes. Do not share medication with anyone else. May cause sensitivity to bright light (dark glasses may help); temporary stinging or blurred vision may occur. Inform prescriber if you experience eye pain, redness, burning, watering, dryness, double vision, puffiness around eye, vision changes, other adverse eye response, worsening of condition, or lack of improvement.

Gel: This preparation is for topical use only. Treatment may take up to 3 months. Do not use more often than recommended; use at regular intervals. Wash hands before and after use. Follow directions on prescription label. Gently apply enough of the gel to cover the lesion. Advise prescriber if you are using any other skin preparations. Avoid direct sunlight and sunlamps while using this medication. You may experience dry skin, itching, peeling, swelling, or tingling at site of application. If severe skin reaction develops, stop applications and notify your prescriber at once.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Gel, as sodium:

    Solaraze®: 3% (50 g, 100 g)

    Voltaren® Gel: 1% (100 g)

Solution, ophthalmic, as sodium [drops]: 0.1% (2.5 mL, 5 mL)

    Voltaren Ophthalmic®: 0.1% (2.5 mL, 5 mL)

Tablet, as potassium: 50 mg

    Cataflam®: 50 mg

Tablet, delayed release, enteric coated, as sodium: 50 mg, 75 mg

    Voltaren®: 25 mg [DSC], 50 mg [DSC], 75 mg

Tablet, extended release, as sodium: 100 mg

    Voltaren®-XR: 100 mg

Transdermal system, topical, as epolamine:

    Flector®: 1.3% (30s) [180 mg]

Generic AvailableYes: Excludes gel, patch

Pricing: U.S. (www.drugstore.com)

Gel (Solaraze)

    3% (50): $205.80

    3% (100): $350.74

Gel (Voltaren)

1% (100): $32.99

Patch (Flector)

1.3% (30): $155.99

Solution (Voltaren)

0.1% (2.5): $49.11

0.1% (5): $76.99

Tablet, 24-hour (Diclofenac Sodium CR)

100 mg (30): $74.92

Tablet, 24-hour (Voltaren-XR)

100 mg (30): $175.43

Tablet, EC (Diclofenac Sodium)

25 mg (60): $42.38

50 mg (90): $35.99

75 mg (60): $26.99

Tablet, EC (Voltaren)

25 mg (60): $58.09

75 mg (60): $174.97

Tablets (Cataflam)

50 mg (100): $328.51

Tablets (Diclofenac Potassium)

50 mg (60): $39.99

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Cataflam® is more rapid than sodium salt (Voltaren®) because it dissolves in the stomach instead of the duodenum

Absorption: Topical gel: 6% to 10%

Protein binding: 99% to albumin

Metabolism: Hepatic to several metabolites

Half-life elimination: 2 hours; Patch: ~12 hours

Time to peak, serum: Cataflam®: ~1 hour; Flector®: 10-20 hours; Solaraze® Gel: ~5 hours; Voltaren®: ~2 hours; Voltaren® Gel: 10-14 hours

Excretion: Urine (65%); feces (35%)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness or dizziness; may rarely cause depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease the clearance of lithium resulting in elevated serum levels and potential toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Index TermsDiclofenac Epolamine; Diclofenac Potassium; Diclofenac Sodium

Dicloxacillin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(dye kloks a SIL in)
Canadian Brand NamesDycill®; Pathocil®
Pharmacologic CategoryAntibiotic, Penicillin
Use: Labeled IndicationsTreatment of systemic infections such as pneumonia, skin and soft tissue infections, and osteomyelitis caused by penicillinase-producing staphylococci
Use: DentalTreatment of susceptible orofacial infections (notably penicillinase-producing staphylococci)
Dosing: Adults

Susceptible infections: Oral: 125-500 mg every 6 hours

Erysipelas, furunculosis, mastitis, otitis externa, septic bursitis, skin abscess: Oral: 500 mg every 6 hours

Impetigo: 250 mg every 6 hours

Prosthetic joint (long-term suppression therapy): Oral: 250 mg twice daily

Staphylococcus aureus, **methicillin susceptible infection if no I.V. access:** Oral: 500-1000 mg every 6-8 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricUse in newborns is not recommended.

Susceptible infections: Oral:

Children <40 kg: 12.5-25 mg/kg/day divided every 6 hours; doses of 50-100 mg/kg/day in divided doses every 6 hours have been used for therapy of osteomyelitis

Children >40 kg: 125-250 mg every 6 hours

Furunculosis: Oral: 25-50 mg/kg/day divided every 6 hours

Osteomyelitis: Oral: 50-100 mg/kg/day in divided doses every 6 hours

Dosing: Renal Impairment

Dosage adjustment is not necessary.

Not dialyzable (0% to 5%); supplemental dose is not necessary.

Peritoneal dialysis effects: Supplemental dose is not necessary.

Continuous arteriovenous or venovenous hemofiltration: Supplemental dose is not necessary.

Administration: OralAdminister 1 hour before or 2 hours after meals. Administer around-the-clock to promote less variation in peak and trough serum levels.
Dietary ConsiderationsAdminister on an empty stomach 1 hour before or 2 hours after meals. Sodium content of 250 mg capsule: 13 mg (0.6 mEq).
ContraindicationsHypersensitivity to dicloxacillin, penicillin, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea and pseudomembranous colitis.

Concurrent drug therapy issues:

- Warfarin: Monitor PT if patient is concurrently on warfarin.

Special populations:

- Neonates: Use with caution in neonates; elimination of drug is slow.

Geriatric ConsiderationsNo dosage adjustment for renal function is necessary.
Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, dicloxacillin is classified as pregnancy category B. Dicloxacillin crosses the placenta. Teratogenic effects have not been reported with dicloxacillin, but adequate and well-controlled studies of dicloxacillin have not been completed in pregnant women. Other penicillins are considered safe for use in pregnancy.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if dicloxacillin crosses into human milk. The manufacturer recommends that caution be exercised when administering dicloxacillin to nursing women. Other penicillins distribute into human milk and are considered safe for use during breast-feeding. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Dicloxacillin in Pregnancy & Lactation

Adverse Reactions

1% to 10%: Gastrointestinal: Nausea, diarrhea, abdominal pain

<1%: Fever, seizure with extremely high doses and/or renal failure, rash (maculopapular to exfoliative), vomiting, pseudomembranous colitis, vaginitis, eosinophilia, leukopenia, neutropenia, thrombocytopenia, agranulocytosis, anemia, hemolytic anemia, prolonged PT, hepatotoxicity, transient elevated LFTs, hematuria, interstitial nephritis, increased BUN/creatinine, serum sickness-like reactions, hypersensitivity

Metabolism/Transport Effects**Induces** CYP3A4 (weak)

Drug Interactions

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Dicloxacillin may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Decreases drug absorption rate; decreases drug serum concentration.

Test InteractionsFalse-positive urine and serum proteins; false-positive in uric acid, urinary steroids; may interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®); may inactivate aminoglycosides *in vitro*

Monitoring ParametersMonitor prothrombin time if patient concurrently on warfarin; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess allergy history prior to beginning therapy. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating therapy.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take medication as directed, with a large glass of water 1 hour before or 2 hours after meals. Take at regular intervals around-the-clock and take for length of time prescribed. If you have diabetes, drug may cause false test results with Clinitest® urine glucose monitoring; use of another type of glucose monitoring is preferable. May cause some gastric distress (small, frequent meals may help) and diarrhea (if this persists, consult prescriber). Report fever, vaginal itching, persistent diarrhea, sores in the mouth, loose foul-smelling stools, yellowing of skin or eyes, or change in color of urine or stool. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg, 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Dicloxacillin Sodium)

500 mg (30): $21.99

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: 35% to 76%; rate and extent reduced by food

Distribution: Throughout body with highest concentrations in kidney and liver; CSF penetration is low

Protein binding: 96%

Half-life elimination: 0.6-0.8 hour; slightly prolonged with renal impairment

Time to peak, serum: 0.5-2 hours

Excretion: Feces; urine (56% to 70% as unchanged drug); prolonged in neonates

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Prolonged use of penicillins may lead to development of oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusPenicillins have been reported to cause apprehension, illusions, agitation, insomnia, depersonalization, and encephalopathy

Mental Health: Effects on Psychiatric TreatmentRarely may cause agranulocytosis; use caution with clozapine and carbamazepine

Index TermsDicloxacillin Sodium

Dicyclomine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Dicyclomine may be confused with diphenhydrAMINE, doxycycline, dyclonine

Bentyl® may be confused with Aventyl®, Benadryl®, Bontril®, Cantil®, Proventil®, Trental®

Pronunciation(dye SYE kloe meen)
U.S. Brand NamesBentyl®
Canadian Brand NamesBentylol®; Formulex®; Lomine; Riva-Dicyclomine
Pharmacologic CategoryAnticholinergic Agent
Use: Labeled IndicationsTreatment of functional bowel/irritable bowel syndrome
Use: Unlabeled/InvestigationalUrinary incontinence
Dosing: AdultsGastrointestinal motility disorders/irritable bowel:

Oral: Initiate with 80 mg/day in 4 equally divided doses, then increase up to 160 mg/day

I.M. **(should not be used I.V.)**: 80 mg/day in 4 divided doses (20 mg/dose)

Dosing: Elderly10-20 mg 4 times/day; increasing as necessary to 160 mg/day
Administration: I.M.Administer solution for injection as I.M. injection only.
Administration: I.V.Do not administer I.V.
Administration: OralAdminister 30-60 minutes before a meal.
StorageProtect from light.
ContraindicationsHypersensitivity to dicyclomine or any component of the formulation; obstructive diseases of the GI tract; severe ulcerative colitis; reflux esophagitis; unstable cardiovascular status in acute hemorrhage; obstructive uropathy; narrow-angle glaucoma; myasthenia gravis; breast-feeding; should not be used in infants <6 months of age
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Diarrhea: May be a sign of incomplete intestinal obstruction, treatment should be discontinued if this occurs.
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.
- Psychosis: Has been reported in patients with an extreme sensitivity to anticholinergic effects or at excessive dosages.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease, tachyarrhythmias, heart failure, or hypertension; evaluate tachycardia prior to administration.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Hiatal hernia: Use with caution in patients with hiatal hernia.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Neuropathy: Use with caution in patients with autonomic neuropathy.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia (known or suspected).
- Renal impairment: Use with caution in patients with renal impairment.
- Ulcerative colitis: Use with caution in patients with mild-moderate ulcerative colitis.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for anticholinergic effects, confusion, and hallucinations.
- Pediatrics: Safety and efficacy have not been established in children. Serious respiratory reactions, central nervous symptoms, and deaths have been reported following administration to infants; use in infants <6 months of age is contraindicated).

Geriatric ConsiderationsLong-term use of antispasmodics should be avoided in the elderly. The potential for a toxic reaction is greater than the potential benefit. In addition, the anticholinergic effects of dicyclomine are not well tolerated in the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects have not been observed in animal studies.

LactationEnters breast milk/contraindicated

Adverse ReactionsAdverse reactions are included here that have been reported for pharmacologically similar drugs with anticholinergic/antispasmodic action.

Cardiovascular: Palpitation, syncope, tachycardia

Central nervous system: Dizziness (29%), lightheadedness (11%), drowsiness (9%), tingling, headache, nervousness (6%), numbness, mental confusion and/or excitement, dyskinesia, lethargy, speech disturbance, insomnia

Dermatologic: Rash, urticaria, itching, and other dermal manifestations

Endocrine & metabolic: Suppression of lactation

Gastrointestinal: Xerostomia (33%), nausea (14%), vomiting, constipation, bloated feeling, abdominal pain, taste loss, anorexia

Genitourinary: Urinary hesitancy, urinary retention, impotence

Local: Irritation (injection), focal coagulation necrosis (injection)

Neuromuscular & skeletal: Weakness (7%)

Ocular: Blurred vision (27%), diplopia, mydriasis, cycloplegia, increased ocular tension

Respiratory: Dyspnea, apnea, asphyxia, nasal stuffiness or congestion, sneezing, throat congestion

Miscellaneous: Anaphylaxis, diaphoresis decreased, severe allergic reaction

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersPulse, anticholinergic effect, urinary output, GI symptoms

Nursing: Physical Assessment/MonitoringSee Contraindications and Warnings/Precautions for use cautions. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (see Drug Interactions). Assess effectiveness of therapy and adverse response (see Adverse Reactions and Overdose/Toxicology - eg, anticholinergic response). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (see Patient Education). Breast-feeding is contraindicated.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber (especially antihistamines, sleeping aids, or antidepressants). Take as directed before meals; do not increase dose and do not discontinue without consulting prescriber. Avoid alcohol. Void before taking medication. This drug may impair mental alertness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or constipation (increased exercise, fluids, fruit, or fiber may help). Report excessive and persistent anticholinergic effects (blurred vision, headache, flushing, tachycardia, nervousness, dizziness, insomnia, mental confusion or excitement, dry mouth, altered taste perception, dysphagia, palpitations, bradycardia, urinary hesitancy or retention, impotence, decreased sweating); change in color of urine or stools; or irritation or redness at injection site. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 10 mg

Bentyl®: 10 mg

Injection, solution, as hydrochloride: 10 mg/mL (2 mL)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

FDA Early Communication: Increased Risk of Myocardial Infarction Observed - March 2008

The Food and Drug Administration (FDA) has issued an Early Communication to patients, caregivers, and healthcare professionals informing them of new evidence regarding the use of abacavir (Ziagen®) and didanosine (Videx®) and the risk of myocardial infarction (MI). Analysis from the Data Collection on Adverse Events of Anti-HIV Drugs (D:A:D) Study, an observational study aimed at investigating the adverse effects of certain nucleoside reverse transcriptase inhibitors (NRTI) involving over 33,000 patients, suggests that patients taking Ziagen® or Videx® appear to be at an increased risk for MI in comparison to other NRTIs. The risk of MI appears to be greatest with recent use (within 6 months) and in patients with existing risk factors for heart disease (eg, hypercholesterolemia, hypertension, diabetes, smoking, and age). In addition, the risk of MI appears to be reversible upon discontinuation of the offending agents. Patients taking didanosine (Videx®) may have up to a 49% increase in their risk of MI according to study results.

The FDA emphasizes that these are preliminary results of the D:A:D study and urges healthcare providers to weigh the potential risks and benefits of every treatment option until further results become available.

Additional information is available at http://www.fda.gov/cder/drug/early_comm/abacavir.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Videx® may be confused with Lidex®

Pronunciation(dye DAN oh seen)

U.S. Brand NamesVidex®; Videx® EC

Canadian Brand NamesVidex®; Videx® EC

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of HIV infection; always to be used in combination with at least two other antiretroviral agents

Dosing: Adults**Treatment of HIV infection:** Oral (administer on an empty stomach):
Dosing based on patient weight:

Pediatric powder for oral solution (Videx®):

<60 kg: 125 mg twice daily (preferred) or 250 mg once daily

≥60 kg: 200 mg twice daily (preferred) or 400 mg once daily

Delayed release capsule (Videx® EC):

25 kg to <60 kg: 250 mg once daily

≥60 kg; 400 mg once daily

When taken with tenofovir:

<60 kg and Cl_{cr} ≥60 mL/minute: 200 mg once daily

≥60 kg and Cl_{cr} ≥60 mL/minute: 250 mg once daily

Dosing: ElderlyRefer to adult dosing. Elderly patients have a higher frequency of pancreatitis (10% versus 5% in younger patients); monitor renal function and dose accordingly

Dosing: Pediatric**Treatment of HIV infection:** Oral (administer on an empty stomach):

Pediatric powder for oral solution (Videx®):

Infants 2 weeks to 8 months: 100 mg/m^2 twice daily is recommended by the manufacturer; 50 mg/m^2 may be considered in infants 2 weeks to 4 months (AIDSinfo guidelines)

Infants and Children >8 months: 120 mg/m^2 twice daily is recommended by the manufacturer. **Note:** AIDSinfo guidelines suggest a range of 90-150 mg/m^2 twice daily

Children 3-21 years (AIDSinfo guidelines): Treatment-naive: 240 mg/m^2/dose once daily (maximum: 400 mg/dose)

Delayed release capsule (Videx® EC):

20 kg to <25 kg: 200 mg once daily

25 kg to <60 kg: 250 mg once daily

≥60 kg: 400 mg once daily

Dosing: Renal ImpairmentChildren: No specific guidelines available; consider dosage reduction.Adults: Dosing based on patient weight, creatinine clearance, and dosage form: See table.

Recommended Dose (mg) of Didanosine by Body Weight – Adults

Creatinine Clearance (mL/min)	**≥60 kg**		**<60 kg**	
	Powder for Oral Solution	**Delayed Release Capsule**	**Powder for Oral Solution**	**Delayed Release Capsule**
≥60	400 mg daily or 200 mg twice daily	400 mg daily	250 mg daily or 125 mg twice daily	250 mg daily
30-59	200 mg daily or 100 mg twice daily	200 mg daily	150 mg daily or 75 mg twice daily	125 mg daily
10-29	150 mg daily	125 mg daily	100 mg daily	125 mg daily
<10	100 mg daily	125 mg daily	75 mg daily	See Note.
Note: Per manufacturer, not suitable for use in patients <60 kg with Cl_{cr} <10 mL/minute; use alternate formulation.				

Patients requiring hemodialysis or CAPD: Dose per Cl_{cr} <10 mL/minute. No didanosine removed via CAPD.

Hemodialysis: Minimal amount of dose (≤7%) removed by hemodialysis; no supplemental dosing necessary

Dosing: Hepatic ImpairmentShould be considered; monitor for toxicity.

Calculations

- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralPediatric powder for oral solution: Prior to dispensing, the powder should be mixed with purified water USP to an initial concentration of 20 mg/mL and then further diluted with an appropriate antacid suspension to a final mixture of 10 mg/mL. Shake well prior to use. Videx® EC: Administer on an empty stomach at least 1 hour before or 2 hours after eating; swallow capsule whole.

Dietary ConsiderationsVidex® EC: Take on an empty stomach; administer at least 1 hour before or 2 hours after eating

StorageDelayed release capsules should be stored in tightly closed bottles at controlled room temperature of 25°C (77°F). Unreconstituted powder should be stored at 15°C to 30°C (59°F to 86°F). Reconstituted pediatric solution is stable for 30 days if refrigerated.

ReconstitutionVidex® pediatric powder: Add 100 mL or 200 mL purified water, USP to the 2 g or 4 g container, respectively, to achieve a 20 mg/mL solution. Immediately mix the resulting solution with an equal volume of Mylanta® Maximum Strength (or equivalent) to achieve a final concentration of 10 mg/mL.

ContraindicationsThere are no contraindications listed in manufacturer's labeling.

Warnings/Precautions

Boxed warnings:

- Lactic acidosis/hepatomegaly: See "Concerns related to adverse effects" below.

- Pancreatitis: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).

- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).

- Ocular effects: Retinal changes (including retinal depigmentation) and optic neuritis have been reported in adults and children using didanosine; patients should undergo retinal examination every 6-12 months.

- Pancreatitis: **[U.S. Boxed Warning]: Pancreatitis (sometimes fatal) has been reported;** incidence is dose related. Risk factors for developing pancreatitis may include a previous history of the condition, concurrent cytomegalovirus or *Mycobacterium avium-intracellulare* infection, renal impairment, advanced age, and concomitant use of stavudine, pentamidine, or hydroxyurea; discontinue if clinical signs of pancreatitis occur.

- Peripheral neuropathy: Occurs in ~20% of patients receiving the drug; if symptomatic, discontinue therapy; after resolution of symptoms, reinitiation of therapy at a reduced dose may be tolerated. Permanently discontinue if neuropathy recurs.

Disease-related concerns:

- Heart failure/edema: Use with caution in patients with HF, edema and/or patients on sodium-restricted diets.

- Hepatic impairment: Use with caution in patients with hepatic impairment; safety and efficacy have not been established in patients with significant hepatic disease. Patients on combination antiretroviral therapy with hepatic impairment may be at increased risk of potentially severe and fatal hepatic toxicity; consider interruption or discontinuation of therapy if hepatic impairment worsens.

- Hyperuricemia: Use with caution in patients with hyperuricemia; asymptomatic hyperuricemia has occurred.

- Renal impairment: Use with caution in patients with renal impairment; dose reduction recommended for Cl_{cr} <60 mL/minute.

Concurrent drug therapy issues:

- Hydroxyurea and stavudine: Fatal cases of hepatotoxicity have been reported in HIV patients treated with didanosine in combination with hydroxyurea and stavudine; combination should be avoided.

Dosage form specific issues:

- Delayed release capsules: Didanosine delayed release capsules are indicated for once-daily use.

Geriatric ConsiderationsSince the elderly often have a creatinine clearance <60 mL/minute, monitor closely for adverse reactions and adjust dose accordingly to maintain efficacy (CD4 counts).

Pregnancy Risk FactorB

Pregnancy ConsiderationsCases of fatal and nonfatal lactic acidosis, with or without pancreatitis, have been reported in pregnant women. It is not known if pregnancy itself potentiates this known side effect; however, pregnant women may be at increased risk of lactic acidosis and liver damage. Hepatic enzymes and electrolytes should be monitored frequently during the 3rd trimester of pregnancy. Use during pregnancy only if the potential benefit to the mother outweighs the potential risk of this complication. Didanosine has been shown to cross the placenta. Preliminary information from the antiretroviral pregnancy registry note an increased risk of birth defects with 1st trimester exposure compared to exposure later in pregnancy; no pattern of defects have been noted. Pharmacokinetics are not significantly altered during pregnancy; dose adjustments are not needed. The Perinatal HIV Guidelines Working Group considers didanosine to be an alternative NRTI in dual nucleoside combination regimens; use with stavudine only if no other alternatives are available. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsAs reported in monotherapy studies; risk of toxicity may increase when combined with other agents.

>10%:

Gastrointestinal: Diarrhea (19% to 28%), amylase increased (15% to 17%), abdominal pain (7% to 13%)

Neuromuscular & skeletal: Peripheral neuropathy (17% to 20%)

1% to 10%:

Dermatologic: Rash/pruritus (7% to 9%)

Endocrine & metabolic: Uric acid increased (2% to 3%)

Gastrointestinal: Pancreatitis (1% to 7% dose dependent); patients >65 years of age had a higher frequency of pancreatitis than younger patients

Hepatic: Alkaline phosphatase increased (1% to 4%), ALT increased (6% to 9%), AST increased (6% to 9%)

Postmarketing and/or reports: Acute renal impairment, alopecia, anaphylactoid reaction, anemia, anorexia, arthralgia, chills/fever, diabetes mellitus, dry eyes, dyspepsia, flatulence, granulocytopenia, hepatic steatosis, hepatitis, hyper-/hypoglycemia, hyperlactatemia (symptomatic), hypersensitivity, immune reconstitution syndrome, lactic acidosis/hepatomegaly, leukopenia, lipodystrophy, liver failure, MI, myalgia, myopathy, optic neuritis, pain, parotid gland enlargement, retinal depigmentation, rhabdomyolysis, seizure, sialoadenitis, thrombocytopenia, weakness, xerostomia

Drug Interactions

Allopurinol: May decrease the metabolism of Didanosine. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): Didanosine may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). Enteric coated didanosine capsules are not expected to affect these antifungals. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Atazanavir: Didanosine may decrease the absorption of Atazanavir. Only the buffered formulations of didanosine are of concern. Atazanavir may decrease the serum concentration of Didanosine. Reported with enteric coated didanosine capsules. *Risk D: Consider therapy modification*

Dapsone: Didanosine may decrease the absorption of Dapsone. Didanosine enteric coated capsules should not affect dapsone. *Risk D: Consider therapy modification*

Darunavir: May decrease the serum concentration of Didanosine. More specifically, this interaction is likely due to the effects of food (with which darunavir/ritonavir are taken) on didanosine, which is supposed to be given on an empty stomach. Management: Didanosine should be administered 1 hour prior to or 2 hours after administration of darunavir/ritonavir (which must be taken with food). *Risk D: Consider therapy modification*

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Hydroxyurea: Didanosine may enhance the adverse/toxic effect of Hydroxyurea. An increased risk of pancreatitis, hepatotoxicity and/or neuropathy may exist. *Risk C: Monitor therapy*

Indinavir: Didanosine may decrease the serum concentration of Indinavir. Management: Indinavir should be administered on an empty stomach at least 1 hour apart from administration of buffer-containing formulations of didanosine. *Risk D: Consider therapy modification*

Lopinavir: May decrease the serum concentration of Didanosine. This interaction refers only to lopinavir/ritonavir oral solution, which must be taken with food, and is principally the result of a food-didanosine interaction. Management: Didanosine should be administered 1 hour prior to or 2 hours after administration of lopinavir/ritonavir oral solution (which must be taken with food). Didanosine and lopinavir/ritonavir tablets can be administered together. *Risk D: Consider therapy modification*

Methadone: May decrease the serum concentration of Didanosine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Didanosine may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents (excludes enteric coated formulation of didanosine). *Risk D: Consider therapy modification*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Stavudine: May enhance the adverse/toxic effect of Didanosine. Lactic acidosis (possibly fatal) is of particular concern. *Risk D: Consider therapy modification*

Tenofovir: May diminish the therapeutic effect of Didanosine. Tenofovir may increase the serum concentration of Didanosine. *Risk D: Consider therapy modification*

Tipranavir: May decrease the serum concentration of Didanosine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (increases risk of pancreatitis).

Food: Decreases AUC and C_{max}. Didanosine serum levels may be decreased by 55% if taken with food.

Monitoring ParametersSerum potassium, uric acid, creatinine; hemoglobin, CBC with neutrophil and platelet count, CD4 cells; viral load; liver function tests, amylase; weight gain; perform dilated retinal exam every 6 months

Nursing: Physical Assessment/MonitoringEvaluate risk factors for heart disease. Assess other pharmacological or herbal products patient may be taking for potential interactions; dosing adjustments may be necessary. A list of medications that should not be used is available in each bottle and patients should be provided with this information. Assess results of laboratory tests, effectiveness of therapy (decrease in infections and progress of disease, viral load and CD4 count) and adverse reactions (peripheral neuropathy, hepatotoxicity, optic neuritis) periodically during therapy. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions (including need for annual or semiannual retinal examinations), and adverse symptoms to report.

Monitoring: Lab TestsSerum potassium, uric acid, creatinine, hemoglobin, CBC with neutrophil, platelet count, CD4 cells, liver function, amylase; viral load

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescription or over-the-counter medications, or herbal products during therapy (even if they are not on the list) without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed for full course of therapy. Videx® EC: Take on an empty stomach; administer at least 1 hour before or 2 hours after eating. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. You will need a retinal examination every 6 -12 months. May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help; consult prescriber if nausea or vomiting persists); diarrhea (boiled milk, yogurt or buttermilk may help); changes in body fat (increased in upper back, neck, breast and around trunk, decreased from legs, arms, and face). Seek immediate emergency care if you experience unusual chest pain, palpitations, erratic heart beat or if you suspect you are having a heart attack. Report immediately any loss of sensation, numbness, or tingling in fingers, toes, or feet; persistent unresolved abdominal distress (pain, nausea, vomiting, diarrhea); or signs of infection (burning on urination, perineal itching, white plaques in mouth, unhealed sores, persistent sore throat or cough).
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, delayed release, enteric coated pellets: 200 mg, 250 mg, 400 mg

Capsule, delayed release, enteric coated beadlets:

Videx® EC: 125 mg, 200 mg, 250 mg, 400 mg

Powder for oral solution, pediatric:

Videx®: 2 g, 4 g [makes 10 mg/mL solution after final mixing]

Generic AvailableYes: Delayed release capsule

Pricing: U.S. (www.drugstore.com)

Capsule, delayed release (Didanosine)

200 mg (30): $158.38

250 mg (30): $173.99

400 mg (30): $253.42

Capsule, delayed release (Videx EC)

250 mg (30): $230.99

400 mg (30): $347.97

Solution (reconstituted) (Videx)

2 g (100): $53.99

4 g (200): $105.98

Mechanism of ActionDidanosine, a purine nucleoside (adenosine) analog and the deamination product of dideoxyadenosine (ddA), inhibits HIV replication *in vitro* in both T cells and monocytes. Didanosine is converted within the cell to the mono-, di-, and triphosphates of ddA. These ddA triphosphates act as substrate and inhibitor of HIV reverse transcriptase substrate and inhibitor of HIV reverse transcriptase thereby blocking viral DNA synthesis and suppressing HIV replication.

Pharmacodynamics/Kinetics

Absorption: Subject to degradation by acidic pH of stomach; some formulations are buffered to resist acidic pH; ≤50% reduction in peak plasma concentration is observed in presence of food. Delayed release capsules contain enteric-coated beadlets which dissolve in the small intestine.

Distribution: V_d: Children: 28 L/m^2; Adults: 1.08 L/kg

Protein binding: <5%

Metabolism: Has not been evaluated in humans; studies conducted in dogs show extensive metabolism with allantoin, hypoxanthine, xanthine, and uric acid being the major metabolites found in urine

Bioavailability: Children: 25%; Adults: 42%

Half-life elimination:

Children and Adolescents: 0.8 hour

Adults: Normal renal function: 1.5 hours; active metabolite, ddATP, has an intracellular half-life >12 hours *in vitro*; Renal impairment: 2.5-5 hours

Time to peak: Delayed release capsules: 2 hours; Powder for suspension: 0.25-1.5 hours

Excretion: Urine (~55% as unchanged drug)

Clearance: Total body: Averages 800 mL/minute

Related Information

- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Pharmacotherapy PearlsA high rate of early virologic nonresponse was observed when didanosine, lamivudine, and tenofovir were used as the initial regimen in treatment-naive patients. Use of this combination is not recommended; patients currently on this regimen should be closely monitored for modification of therapy. Early virologic failure was also observed with tenofovir and didanosine delayed release capsules, plus either efavirenz or nevirapine; use caution in treatment-naive patients with high baseline viral loads.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusAnxiety; irritability and insomnia are common; may produce depression

Mental Health: Effects on Psychiatric TreatmentMay cause granulocytopenia; use caution with clozapine and carbamazepine

Index TermsddI; Dideoxyinosine

Use: Labeled IndicationsTreatment of known or suspected internal contamination with plutonium, americium, or curium

Dosing: AdultsInternal contamination with plutonium, americium, or curium: Ca-DTPA is the preferred initial agent; sequential administration of Ca-DTPA then Zn-DTPA is recommended. I.V.:

Initial: Ca-DTPA: 1 g/day

Pregnancy: Zn-DTPA 1 g/day should be used for the initial dose in pregnant women **except** in cases of high internal contamination,

Maintenance: Zn-DTPA: 1 g/day; length of therapy depends on patient response and degree of contamination. **Note:** An equivalent dose of Ca-DTPA should be used for maintenance therapy only if Zn-DTPA is not available.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricInternal contamination with plutonium, americium, or curium: Ca-DTPA is the preferred initial agent; sequential administration of Ca-DTPA then Zn-DTPA is recommended. I.V.:

Children <12 years:

Initial: Ca-DTPA: 14 mg/kg/day (maximum dose: 1 g/day)

Maintenance: Zn-DTPA: 14 mg/kg/day (maximum: 1 g/day); length of therapy depends on patient response and degree of contamination. **Note:** An equivalent dose of Ca-DTPA should be used for maintenance therapy only if Zn-DTPA is not available.

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentDose adjustment not needed. Dialysis may be used to increase rate of elimination after the initial dose. If Ca-DTPA is not available, substitute Zn-DTPA as initial therapy.

Administration: I.V.Dose should be administered once daily.

Infusion: Administer over 30 minutes.

I.V. push: Administer over 3-4 minutes.

Administration: I.V. DetailpH: Ca-DTPA: 7.3-8.3; Zn-DTPA: 6.5-7.5

Administration: InhalationNebulization: Dose should be administered once daily. Patients should be instructed not to swallow any expectorant.

Dietary ConsiderationsFluids should be consumed liberally to promote dilution and excretion of radioactive chelate and minimize radiation exposure to bladder. Supplemental zinc or other vitamins and minerals may be needed.

StorageCa-DTPA, Zn-DTPA: Store between 15°C to 30°C (59°F to 86°F).

ReconstitutionCa-DTPA, Zn-DTPA:

I.V. infusion: Dilute 1 g into 100-250 mL D_5W, NS, or LR.

Nebulization: Dilute to a 1:1 ratio with SWFI or NS.

Warnings/Precautions

Special populations:

- Pediatrics: Safety and efficacy for use by nebulization have not been established in children.

Dosage form specific issues:

- Calcium DTPA (Ca-DTPA): Use is associated with depletion of endogenous trace metals (zinc, magnesium, manganese). Amount of depletion is dependent upon length of therapy; supplements should be provided. The initial treatment dose should be with Ca-DTPA; if additional doses are needed, zinc-DTPA should be used if available due to safety concerns. Use caution with severe hemochromatosis.

- Zinc DTPA (Zn-DTPA): Long-term use may be associated with depletion of magnesium and manganese; supplements should be provided.

Other warnings/precautions:

- Administration: For I.V. administration. May be administered by nebulization in adults whose contamination is only by inhalation within the last 24 hours. When administered by nebulization, use caution with asthma.

- Appropriate use: Treatment is most effective if begun within 24 hours but should be started as soon as available. Treatment with diethylene triamine penta-acetic acid (DTPA) is not effective for uranium, neptunium, or iodine exposure. Appropriate safety measures should be taken to minimize contamination of others.

Pregnancy Risk FactorC (Ca-DTPA)/B (Zn-DTPA)

Pregnancy ConsiderationsTeratogenic effects have been reported with Ca-DTPA in animal studies. Multiple doses during pregnancy may increase adverse effects to the fetus due to zinc depletion. Reproduction studies with Zn-DTPA did not show teratogenic effects in animals; there are no well-controlled studies in pregnant women. Except in cases of high internal contamination, treatment should be initiated and maintained with Zn-DTPA during pregnancy.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsRadiocontaminants such as plutonium, americium, or curium can be found in breast milk; excretion of Ca-DTPA or Zn-DTPA is unknown. Women suspected of internal contamination, regardless of treatment, should not breast feed and precautions should be taken when discarding breast milk.

Adverse ReactionsFrequency not defined.

Cardiovascular: Chest pain

Central nervous system: Headache, lightheadedness

Dermatologic: Dermatitis

Gastrointestinal: Diarrhea, metallic taste, nausea

Local: Injection site reactions

Neuromuscular & skeletal: Pelvic pain

Respiratory: Cough and/or wheezing (using Ca-DTPA following nebulization in patients with asthma)

Miscellaneous: Allergic reaction, magnesium depletion, manganese depletion, metalloproteinases, zinc depletion

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersCBC with differential, BUN, urinalysis, blood and urine radioassays (baseline and throughout therapy); blood, urine, and fecal radioactivity (weekly); serum zinc levels should also be monitored with Ca-DTPA

Nursing: Physical Assessment/MonitoringAssess other prescription and OTC medications the patient may be taking. Monitor laboratory tests. Instruct patient in appropriate measures to use to discard of body fluids and feces. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsCBC with differential, BUN, urinalysis, blood and urine radioassays (baseline and throughout therapy); blood, urine, and fecal radioactivity (weekly); serum zinc levels should also be monitored with Ca-DTPA

Patient EducationRadioactive metals are known to be excreted in the urine, feces, and breast milk. When possible, use toilet instead of urinal, and flush several times after each use. Spilled urine or feces should be cleaned up immediately. Wash hands thoroughly. If blood or urine comes in contact with clothing or linens, wash separately. If coughing productively, dispose of expectorant carefully and avoiding swallowing if possible. It is important to maintain liberal fluid intake (at least 2-3 L/day) unless instructed to restrict intake by prescriber. You may experience headache, lightheadedness, dermatitis, metallic taste, nausea, and diarrhea. Report chest pain, any allergic reactions, coughing and/or wheezing. **Pregnancy/breast-feeding precaution:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended. Use precautions when disposing of breast milk.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Ca-DTPA: 200 mg/mL (5 mL)

Zn-DTPA: 200 mg/mL (5 mL)

Generic AvailableNo

ManufacturerHameln Pharmaceuticals

Mechanism of ActionCa-DTPA and Zn-DTPA form chelates with metal ions. The radioactive chelates are then excreted in the urine. Treatment is most effective when radiocontaminants are in circulation or interstitial fluids. Radiocontaminants eventually sequester in liver and bone, therefore, effectiveness of treatment decreases with time after exposure.

Pharmacodynamics/Kinetics

Absorption:

Ca-DTPA: Oral: Poor (~5%); Inhalation: 20%

Zn-DTPA: Oral: Poor (~5%)

Distribution: Ca-DTPA, Zn-DTPA: Distributed throughout extracellular fluid; not found to accumulate in organs

Metabolism: Ca-DTPA, Zn-DTPA: Minimal

Half-life elimination: Ca-DTPA, Zn-DTPA: May be increased by renal impairment

Excretion: Ca-DTPA, Zn-DTPA: Urine; Rate of excretion may be decreased by renal impairment Ca-DTPA provides a 10-fold higher rate of elimination than Zn-DTPA within the first 24 hours; after 24 hours rate of radioactivity elimination is comparable.

Pharmacotherapy PearlsThe manufacturer provides a Patient Data Form that should be completed for all patients receiving treatment. Information collected will be used to develop long-term response data and information concerning risk of late malignancy development. Procedures for proper collection and disposal of radioactive body fluids (sputum, urine) and dialysis fluid should be followed.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness

Mental Health: Effects on Psychiatric Treatment May cause magnesium depletion; use caution with ziprasidone as magnesium depletion may predispose patient to torsade de pointes.

Index Terms Ca-DTPA; Diethylenetriamine Pentaacetic Acid; DTPA; Pentetate Calcium Trisodium; Pentetate Zinc Trisodium; Trisodium Calcium Diethylenetriaminepentaacetate (Ca-DTPA); Zinc Diethylenetriaminepentaacetate (Zn-DTPA); Zn-DTPA

Diethylpropion

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(dye eth il PROE pee on)

Canadian Brand NamesTenuate®; Tenuate® Dospan®

Pharmacologic CategoryAnorexiant; Sympathomimetic

Use: Labeled IndicationsShort-term (few weeks) adjunct in the management of exogenous obesity

Dosing: AdultsObesity (short-term adjunct): Oral:

Tablet: 25 mg 3 times/day before meals or food

Tablet, controlled release: 75 mg at midmorning

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >16 years: Refer to adult dosing.

Calculations

- Body Mass Index

Administration: OralDose should not be administered in evening or at bedtime.

Tablet: Administer 1 hour before meals.

Tablet, controlled release: Do not crush tablet; administer at midmorning.

Dietary ConsiderationsMost effective when combined with a low calorie diet and behavior modification counseling.

StorageStore at room temperature, below 30°C (86°F).

RestrictionsC-IV

Pharmacotherapy for weight loss is recommended only for obese patients with a body mass index ≥30 kg/m^2, or ≥27 kg/m^2 in the presence of other risk factors such as hypertension, diabetes, and/or dyslipidemia or a high waist circumference; therapy should be used in conjunction with a comprehensive weight management program. Rule out organic causes of obesity (eg, untreated hypothyroidism) prior to use.

Note: Diethylpropion is not approved for long-term use. The limited usefulness of medications in this class should be weighed against possible risks associated with their use. Consult weight loss guidelines for current pharmacotherapy recommendations.

ContraindicationsHypersensitivity or idiosyncrasy to diethylpropion or other sympathomimetic amines; advanced arteriosclerosis, severe hypertension; pulmonary hypertension; hyperthyroidism; glaucoma; agitated states, history of drug abuse; during or within 14 days following MAO inhibitor therapy, concurrent use with other anorectic agents

Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Amphetamines may impair the ability to engage in potentially hazardous activities.
- Primary pulmonary hypertension (PPH): A rare, frequently fatal disease of the lungs, PPH has been found to occur with increased frequency in patients receiving some anorexigens.
- Valvular heart disease: The use of some anorexigens, including diethylpropion, has been associated with the development of valvular heart disease. Avoid stimulants in patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; antidiabetic agent requirements may be altered with anorexigens and concomitant dietary restrictions.
- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate.
- Seizure disorders: Use with caution in patients with a history of seizure disorders; seizures have been reported with use.
- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

Concurrent drug therapy issues:

- Anorexigens: Safety and efficacy have not been established for use with other weight loss medications, including over-the-counter or herbal products. Not recommended for use in patients who have used other anorectic agents within the past year.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children ≤16 years of age.

Other warnings/precautions:

- Abuse potential: Diethylpropion is pharmacologically related to the amphetamines, which have a high abuse potential; prolonged use may lead to dependency. Prescriptions should be written for the smallest quantity consistent with good patient care to minimize possibility of overdose.

- Discontinuation of therapy: Discontinue if satisfactory weight loss has not occurred within the first 4 weeks of treatment, or if tolerance develops.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects have not been observed in animal studies. Crosses the human placenta; spontaneous reports of congenital malformations have been reported, but an association with diethylpropion has not been established. Withdrawal symptoms may occur in the neonate following maternal use of diethylpropion.

LactationEnters breast milk/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, ECG changes, hypertension, palpitation, precordial pain, pulmonary hypertension, tachycardia, valvulopathy

Central nervous system: Anxiety, CVA, depression, dizziness, drowsiness, dysphoria, euphoria, headache, insomnia, jitteriness, malaise, nervousness, overstimulation, psychosis, restlessness, seizure

Dermatologic: Alopecia, ecchymosis, erythema, rash, urticaria

Endocrine & metabolic: Libido changes, gynecomastia, menstrual irregularities

Gastrointestinal: Abdominal discomfort, constipation, diarrhea, nausea, unpleasant taste, vomiting, xerostomia

Genitourinary: Dysuria, impotence, polyuria

Hematologic: Bone marrow depression, agranulocytosis, leukopenia

Neuromuscular & skeletal: Dyskinesia, muscle pain, tremor

Ocular: Blurred vision, mydriasis

Respiratory: Dyspnea

Miscellaneous: Diaphoresis, tachyphylaxis

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersBaseline cardiac evaluation (for preexisting valvular heart disease, pulmonary hypertension); echocardiogram during therapy; weight, waist circumference, blood pressure; renal function in elderly patients

Reference Range

Adult classification of weight by BMI (kg/m^2):

Underweight: <18.5

Normal: 18.5-24.9

Overweight: 25-29.9

Obese, class I: 30-34.9

Obese, class II: 35-39.9

Extreme obesity (class III): ≥40

Waist circumference: In adults with a BMI of 25-34.9 kg/m^2, high-risk waist circumference is defined as:

Men >102 cm (>40 in)

Women >88 cm (>35 in)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for history of psychopathology, homicidal or suicidal tendencies, or addiction; long-term use can result in dependence, abuse, or tolerance. Periodically evaluate the need for continued use. Monitor therapeutic effectiveness, vital signs, and adverse reactions at start of therapy, when changing dosage, and at regular intervals during therapy. Monitor serum glucose closely in patients with diabetes (amphetamines may alter antidiabetic requirements). Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, possible side effects, and symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency without consulting prescriber. Drug may cause physical and/or psychological dependence. Do not crush or chew extended release tablets. Take early in day to avoid sleep disturbance, 1 hour before meals. Avoid alcohol, caffeine, or OTC medications that act as stimulants. You may experience restlessness, false sense of euphoria, or impaired judgment (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth (frequent mouth care, sucking lozenges, or chewing gum may help); nausea or vomiting (small frequent meals, frequent mouth care may help); constipation (increased exercise, fluids, fruit, or fiber may help); or diarrhea (buttermilk, boiled milk, or yogurt may help); or altered libido (reversible). Patients with diabetes need to monitor serum glucose closely (may alter antidiabetic medication requirements). Report chest pain, palpitations, or irregular heartbeat; muscle weakness or tremors; extreme fatigue or depression; CNS changes (aggressiveness, restlessness, euphoria, sleep disturbances); severe unremitting abdominal distress or cramping; changes in sexual activity; changes in urinary pattern; or blurred vision. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 25 mg

Tablet, controlled release, as hydrochloride: 75 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Diethylpropion HCl CR)

75 mg (30): $29.99

Tablets (Diethylpropion HCl)

25 mg (90): $25.99

Tablets (Tenuate)

25 mg (90): $59.99

Mechanism of ActionDiethylpropion s a sympathomimetic amine with pharmacologic properties similar to the amphetamines. It is also structurally similar to bupropion. The mechanism of action in reducing appetite appears to be secondary to CNS effects, including stimulation of the hypothalamus to release norepinephrine

Pharmacodynamics/Kinetics

Metabolism: Forms active metabolites via N-dealkylation and reduction

Half-life elimination: Aminoketone metabolites: ~4-6 hours

Excretion: Urine

Related Information

- Obesity Treatment Guidelines for Adults

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), and metallic taste (the use of local anesthetic without vasoconstrictor is recommended in these patients).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse vasoconstrictor with caution in patients taking diethylpropion. Amphetamine-like drugs such as diethylpropion enhance the sympathomimetic response of epinephrine and norepinephrine leading to potential hypertension and cardiotoxicity.

Mental Health: Effects on Mental StatusInsomnia, nervousness, and euphoria are common; may cause confusion, depression, or psychosis

Mental Health: Effects on Psychiatric TreatmentConcurrent use with MAO inhibitors may cause hypertensive crisis; avoid combination; antipsychotics may blunt effect of diethylpropion. May cause bone marrow depression; use caution with clozapine.

Index TermsAmfepramone; Diethylpropion Hydrochloride

Difenoxin and Atropine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(dye fen OKS in & A troe peen)
U.S. Brand NamesMotofen® [DSC]
Pharmacologic CategoryAntidiarrheal
Use: Labeled IndicationsTreatment of diarrhea
Dosing: AdultsDiarrhea: Oral: Initial: 2 tablets (each tablet contains difenoxin hydrochloride 1 mg and atropine sulfate 0.025 mg), then 1 tablet after each loose stool; 1 tablet every 3-4 hours, up to 8 tablets in a 24-hour period; if no improvement after 48 hours, continued administration is not indicated
Dosing: ElderlyRefer to adult dosing; use with caution.
StorageStore at room temperature 15°C to 30°C (59°C to 86°C).
RestrictionsC-IV
ContraindicationsHypersensitivity to difenoxin, atropine, or any component of the formulation; severe liver disease; jaundice; dehydrated patient; angle-closure glaucoma; children <2 years of age; diarrhea associated with organisms that penetrate the intestinal mucosa (toxigenic *E. coli*, *Salmonella* sp, *Shigella*), and pseudomembranous colitis associated with broad spectrum antibiotics
Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Dehydration/electrolyte imbalance: In case of severe dehydration or electrolyte imbalance, withhold difenoxin/atropine treatment until corrective therapy has been initiated. Use in conjunction with fluid and electrolyte therapy when appropriate. Inhibiting peristalsis may lead to fluid retention in the intestine aggravating dehydration and electrolyte imbalance.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Ulcerative colitis: Use with caution in patients with acute ulcerative colitis; may induce toxic megacolon. Discontinue promptly with abdominal distention.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age; contraindicated in children <2 years of age.

Other warnings/precautions:

- Dosage recommendations: Strictly adhere to dosage recommendations.

Pregnancy Risk FactorC
LactationEnters breast milk/contraindicated
Breast-Feeding ConsiderationsPotential for serious adverse reactions in nursing infants.
Adverse Reactions1% to 10%:

Central nervous system: Dizziness, drowsiness, lightheadedness, headache

Gastrointestinal: Nausea, vomiting, xerostomia, epigastric distress

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy*

modification

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Nursing: Physical Assessment/MonitoringSee individual agent for Atropine.
Patient EducationSee individual agent for Atropine.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, oral:

Motofen®: Difenoxin hydrochloride 1 mg and atropine sulfate 0.025 mg [DSC]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Motofen)

1-0.025 mg (15): $16.46

Pharmacodynamics/Kinetics

Absorption: Rapid and well absorbed

Metabolism: To inactive hydroxylated metabolite

Time to peak, plasma: Within 40-60 minutes

Excretion: Urine and feces (primarily as conjugates)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation)
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness; confusion
Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropic may cause additive sedation or dry mouth

Medication Safety Issues

Sound-alike/look-alike issues:

International issues:

Florone® may be confused with Fluoron® which is a brand name for fluorine in Canada

Florone® may be confused with Flogene® which is a brand name for fentiazac in Italy and a brand name for piroxicam in Brazil

Pronunciation(dye FLOR a sone)
U.S. Brand NamesApexiCon™; ApexiCon™ E
Pharmacologic CategoryCorticosteroid, Topical
Use: Labeled IndicationsRelieves inflammation and pruritic symptoms of corticosteroid-responsive dermatosis (high to very high potency topical corticosteroid)
Dosing: AdultsCorticosteroid-responsive dermatosis: Topical: Apply ointment sparingly 1-3 times/day; apply cream sparingly 2-4 times/day. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to diflorasone
Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC
Adverse Reactions<1%: Arthralgia, burning, dryness, folliculitis, itching, maceration, muscle atrophy, secondary infection
Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Patient EducationA thin film of cream or ointment is effective; do not overuse. Do not use tight-fitting diapers or plastic pants on children being treated in the diaper area. Use only as prescribed, and for no longer than the period prescribed. Apply sparingly in light film. Rub in lightly. Avoid contact with eyes. Notify prescriber if condition being treated persists or worsens. **Pregnancy precaution:** Inform prescriber if you are pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, as diacetate: 0.05% (15 g, 30 g, 60 g)

ApexiCon™ E: 0.05% (30 g, 60 g)

Ointment, as diacetate: 0.05% (15 g, 30 g, 60 g)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Dolobid® (discontinued U.S. brand name [generics available]) may be confused with Slo-Bid®

International issues: Dolobid® (brand name product available in multiple international markets) may be confused with Slo-Bid®

Pronunciation(dye FLOO ni sal)

Canadian Brand NamesApo-Diflunisal®; Novo-Diflunisal; Nu-Diflunisal

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsManagement of inflammatory disorders usually including rheumatoid arthritis and osteoarthritis; can be used as an analgesic for treatment of mild-to-moderate pain

Use: DentalTreatment of postoperative pain

Dosing: Adults

Mild-to-moderate pain: Oral: Initial: 500-1000 mg followed by 250-500 mg every 8-12 hours; maximum daily dose: 1.5 g

Arthritis: Oral: 500-1000 mg/day in 2 divided doses; maximum daily dose: 1.5 g

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Use with caution; Cl_{cr} <50 mL/minute: Administer 50% of normal dose (Aronoff, 1998)

Hemodialysis: No supplement required

CAPD: No supplement require

CAVH: Dose for GFR 10-50

Calculations

- Creatinine Clearance: Adults

Administration: OralTablet should be swallowed whole; do not crush or chew.

Dietary ConsiderationsShould be taken with food to decrease GI distress.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to diflunisal, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy

should be monitored for anemia.

- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin's cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Hypersensitivity syndrome: A hypersensitivity syndrome has been reported; monitor for constitutional symptoms and cutaneous findings; other organ dysfunction may be involved.

- Reye's syndrome: Diflunisal is a derivative of acetylsalicylic acid and therefore may be associated with Reye's syndrome.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsThe elderly are a high-risk population for adverse effects from nonsteroidal anti-inflammatory agents. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC (1st and 2nd trimesters)/D (3rd trimester)

Pregnancy ConsiderationsTeratogenic effects have been documented in animal studies. However, known effects of NSAIDs suggest the potential for premature ductus arteriosus closure, particularly in late pregnancy. There are no adequate and well-controlled studies in pregnant women.

LactationEnters breast milk/not recommended

Adverse Reactions

1% to 10%:

Central nervous system: Headache (3% to 9%), dizziness (1% to 3%), insomnia (1% to 3%), somnolence (1% to 3%), fatigue (1% to 3%)

Dermatologic: Rash (3% to 9%)

Gastrointestinal: Nausea (3% to 9%), dyspepsia (3% to 9%), GI pain (3% to 9%), diarrhea (3% to 9%), constipation (1% to 3%), flatulence (1% to 3%), vomiting (1% to 3%), GI ulceration

Otic: Tinnitus (1% to 3%)

<1%: Acute anaphylactic reaction, agranulocytosis, allergic reactions, angioedema, anorexia, blurred vision, bronchospasm, confusion, chest pain, cholestasis, cystitis, depression, diaphoresis, disorientation, dry mucous membranes, dyspnea, dysuria, edema, eructation, erythema multiforme, esophagitis, exfoliative dermatitis, flushing, gastritis, GI bleeding, GI perforation, hallucinations, hearing decreased, hearing loss, hematuria, hemolytic anemia, hepatitis, hypersensitivity syndrome, hypersensitivity vasculitis, interstitial nephritis, itching, jaundice, mental depression, muscle cramps, necrotizing fasciitis, nephrotic syndrome, nervousness, palpitation,

paresthesia, peptic ulcer, peripheral neuropathy, photosensitivity, proteinuria, pruritus, renal impairment, renal failure, seizure, Stevens-Johnson syndrome, stomatitis, syncope, tachycardia, thrombocytopenia, toxic epidermal necrolysis, trembling, urticaria, vasculitis, vertigo, weakness, wheezing

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsFalsely elevated increase in serum salicylate levels

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. **Assess patient for allergic reaction to salicylates or other NSAIDs.** Assess other medications patient may be taking for additive or adverse interactions. Monitor blood pressure at the beginning of therapy and periodically during use. Monitor therapeutic effectiveness and signs of adverse reactions or overdose at beginning of therapy and periodically during long-term therapy. Schedule ophthalmic evaluations for patients who develop eye complaints during long-term NSAID therapy. Assess knowledge/teach patient appropriate use, appropriate interventions to reduce side effects, and adverse reactions to report.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Adverse reactions can occur with overuse. Consult your prescriber before use if you have hypertension or heart failure. Do not take longer than 3 days for fever, or 10 days for pain without consulting medical advisor. Take with food or milk. While using this medication, do not use alcohol, excessive amounts of vitamin C, or salicylate-containing foods (curry powder, prunes, raisins, tea, or licorice), other prescription or OTC medications containing aspirin or salicylate, or other NSAIDs without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nausea, vomiting, gastric discomfort (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help). GI bleeding, ulceration, or perforation can occur with or without pain. Stop taking medication and report ringing in ears; persistent stomach pain; unresolved nausea or vomiting; respiratory difficulty or shortness of breath; unusual bruising or bleeding (mouth, urine, stool); skin rash; flu-like symptoms; unexplained weight gain; unusual swelling of extremities; chest pain; or palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Diflunisal)

500 mg (60): $59.99

Tablets (Dolobid)

500 mg (60): $84.98

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has analgesic and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Analgesic: ~1 hour; maximal effect: 2-3 hours

Duration: 8-12 hours

Absorption: Well absorbed

Protein binding: >99%

Distribution: Enters breast milk

Metabolism: Extensively hepatic; metabolic pathways are saturable

Half-life elimination: 8-12 hours; prolonged with renal impairment

Time to peak, serum: 2-3 hours

Excretion: Urine (~3% as unchanged drug, 90% as glucuronide conjugates) within 72-96 hours

Related Information

- Nonsteroidal Anti-inflammatory Agents

Pharmacotherapy PearlsDiflunisal is a salicylic acid derivative which is chemically different than aspirin and is not metabolized to salicylic acid. It is not considered a salicylate. Diflunisal 500 mg is equal in analgesic efficacy to aspirin 650 mg, acetaminophen 650 mg, and acetaminophen 650 mg/propoxyphene napsylate 100 mg, but has a longer duration of effect (8-12 hours). Not recommended as an antipyretic. Not found to be clinically useful to treat fever; at doses ≥2 g/day, platelets are reversibly inhibited in function. Diflunisal is uricosuric at 500-750 mg/day; causes less GI and renal toxicity than aspirin and other NSAIDs; fecal blood loss is $^{1}/_{2}$ that of aspirin at 2.6 g/day.

Dental Health Professional ConsiderationsThe advantage of diflunisal as a pain reliever is its 12-hour duration of effect. In many cases, this long effect will ensure a full night sleep during the postoperative pain period.

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®). See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; rarely may cause insomnia, nervousness, depression, and hallucinations

Mental Health: Effects on Psychiatric Treatment May rarely cause may agranulocytosis; use caution with clozapine and carbamazepine; may decrease the clearance of lithium resulting in elevated serum levels and potential toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A recent meta-analysis (see References) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents including ibuprofen and naproxen may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin’s inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other Considerations The 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Diflunisal is a salicylic acid derivative which is chemically different than aspirin and is not metabolized to salicylic acid. Diflunisal 500 mg is equal in analgesic efficacy to aspirin 650 mg, acetaminophen 650 mg, and acetaminophen 650 mg/propoxyphene napsylate 100 mg, but has a longer duration of effect (8-12 hours). It is not recommended as an antipyretic. At doses ≥2 g/day, platelets are reversibly inhibited in function. Diflunisal is uricosuric at 500-750 mg/day. It causes less GI and renal toxicity than aspirin and other NSAIDs. Fecal blood loss is $^1/_2$ that of aspirin at 2.6 g/day.

Difluprednate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(dye floo PRED nate)

U.S. Brand NamesDurezol™

Pharmacologic Category[Corticosteroid, Ophthalmic]()

Use: Labeled IndicationsTreatment of inflammation and pain following ocular surgery

Dosing: Adults**Anti-inflammatory:** Ophthalmic: Adults: Instill 1 drop in conjunctival sac of the affected eye(s) 4 times/day beginning 24 hours after surgery, continue for 2 weeks, then decrease to 2 times/day for 1 week, then taper based on response

Dosing: ElderlyRefer to adult dosing.

StorageStore at 15°C to 25°C (59°F to 77°F); do not freeze. Protect from light.

ContraindicationsActive viral (including herpes simplex keratitis, vaccinia, varicella) infections of the cornea or conjunctiva, fungal infection of ocular structures, or mycobacterial ocular infections

Warnings/Precautions

Concerns related to adverse effects:

- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression. If signs and symptoms of infection do not improve after 2 days, patient should be re-evaluated.

- Ocular effects: Prolonged use may result in glaucoma and injury to the optic nerve, as well as, visual defects in acuity and field of vision. Posterior subcapsular cataracts may form after long-term use. Use with caution in presence of glaucoma (steroids increase intraocular pressure). Perforation may occur with topical steroids in diseases which thin the cornea or sclera. Steroid use may delay healing after cataract surgery. Intraocular pressure should be monitored if this product is used ≥10 days.

Special populations:

- Contact lens wearers: Contains sorbic acid which may be adsorbed by contact lenses; it is not recommended to wear contacts while using difluprednate.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only; not for intraocular administration. Initial prescription and renewal of medication for >28 days should be made by healthcare provider only after examination with the aid of magnification such as slit lamp biomicroscopy or fluorescein staining (if appropriate).

Geriatric ConsiderationsEvaluate patient's ability to self-administer eye drops.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

5% to 15%: Ocular: Anterior chamber cells/flare, blepharitis, ciliary and conjunctival hyperemia, conjunctival/corneal edema, pain, photophobia, posterior capsule opacification

1% to 5%: Ocular: Inflammation, iritis, punctuate keratitis, visual acuity reduced

<1%: Application site discomfort/irritation, cataracts, corneal pigmentation and striae, episcleritis, eyelid crusting, foreign body sensation, intraocular pressure increased, lacrimation increased, macular edema, ocular pruritus, optic nerve damage, perforation of globe, sclera hyperemia, secondary ocular infection, uveitis

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Monitoring ParametersIntraocular pressure and periodic examination of lens (with prolonged use >28 days)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Emulsion, ophthalmic:

Durezol™: 0.05% (5 mL) [contains sorbic acid]

Generic AvailableNo

ManufacturerSirion Therapeutics, Inc

Mechanism of ActionCorticosteroids inhibit the inflammatory response including edema, capillary dilation, leukocyte migration, and scar formation. Difluprednate penetrates cells readily to induce the production of lipocortins. These proteins modulate the activity of prostaglandins and leukotrienes.

Pharmacodynamics/KineticsAbsorption: Systemic: Limited

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Digoxin Immune Fab

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(di JOKS in i MYUN fab)

U.S. Brand Names Digibind®; DigiFab™

Canadian Brand Names Digibind®

Pharmacologic Category Antidote

Use: Labeled Indications Treatment of life-threatening or potentially life-threatening digoxin intoxication, including:

- acute digoxin ingestion (ie, >10 mg in adults or >4 mg in children)
- chronic ingestions leading to steady-state digoxin concentrations >6 ng/mL in adults or >4 ng/mL in children
- manifestations of digoxin toxicity due to overdose (life-threatening ventricular arrhythmias, progressive bradycardia, second- or third-degree heart block not responsive to atropine, serum potassium >5 mEq/L in adults or >6 mEq in children)

Dosing: Adults Each vial of Digibind® 38 mg or DigiFab™ 40 mg will bind ~0.5 mg of digoxin or digitoxin.

Note: Estimation of the dose is based on the body burden of digitalis. This may be calculated if the amount ingested is known or the postdistribution serum drug level is known (round dose to the nearest whole vial). If the amount of ingestion is unknown, general dosing guidelines should be used.

Acute ingestion of unknown amount: I.V.: 20 vials is adequate to treat most life-threatening ingestions. May give as a single dose or give 10 vials, observe response, and give a second 10 vial dose if indicated.

Acute ingestion of known amount: I.V.:

Based on number of tablets/capsules ingested:

Step 1:

Total body load (mg) = Amount (mg) digoxin capsules/digitoxin ingested

Step 2:

Dose (vials) = Total body load (mg) / (0.5 mg digitalis bound/vial)

Alternatively, the following table gives an estimation of the number of vials needed based on the number of digoxin tablets or capsules ingested.

Number of Digoxin Tablets or Capsules Ingested[1]	Dose of Digoxin Immune Fab (# of Vials)
25	10
50	20
75	30
100	40
150	60
200	80
[1] 250 mcg tablets with 80% bioavailability or 200 mcg Lanoxicaps® capsules with 100% bioavailability.	

Based on steady-state serum digoxin concentration: Adults:

Step 1:

Dose (vials) = [(serum digoxin concentration [ng/mL] x weight [kg]) / 100

Alternatively, the following table gives an estimation of the number of vials needed based on the steady-state serum digoxin concentration.

Adult Dose Estimates of Digibind® (in # of Vials) From Steady-State Serum Digoxin Concentration

Patient Weight (kg)	Serum Digoxin Concentration (ng/mL)						
	1	**2**	**4**	**8**	**12**	**16**	**20**
40	0.5 v	1 v	2 v	3 v	5 v	7 v	8 v
60	0.5 v	1 v	3 v	5 v	7 v	10 v	12 v
70	1 v	2 v	3 v	6 v	9 v	11 v	14 v
80	1 v	2 v	3 v	7 v	10 v	13 v	16 v
100	1 v	2 v	4 v	8 v	12 v	16 v	20 v
v = vials.							

Based on steady-state digitoxin concentration: Children and Adults: If the calculated dose based on the digitoxin concentration is different than that for the digoxin concentration, use the higher dose.

Step 1:

Dose (vials) = [serum digitoxin concentration (ng/mL) x weight (kg)] / 1000

Chronic toxicity (serum digoxin concentration unavailable): I.V.: Adults: 6 vials is adequate to reverse most cases of toxicity

⇧ Dosing: ElderlyRefer to adult dosing.

⇧ Dosing: PediatricEach vial of Digibind® 38 mg or DigiFab™ 40 mg will bind ~0.5 mg of digoxin or digitoxin.

Note: Estimation of the dose is based on the body burden of digitalis. This may be calculated if the amount ingested is known or the postdistribution serum drug level is known (round dose to the nearest whole vial). If the amount of ingestion is unknown, general dosing guidelines should be used.

Acute ingestion of unknown amount: I.V.: Refer to adult dosing.

Acute ingestion of known amount: I.V.: Refer to adult dosing.

Based on steady-state serum digoxin concentration: Infants and Children ≤20 kg: May require smaller doses; calculate dose in milligrams, reconstitute with NS, and administer dose via tuberculin syringe

Step 1:

Dose (mg) = [(serum digoxin concentration [ng/mL] x weight [kg]) / 10] x (mg/vial)[1]

[1] Digibind® 38 mg/vial or DigiFab™ 40 mg/vial

Alternatively, the following table gives an estimation of the amount of **Digibind®** needed based on the steady-state serum digoxin concentration.

Infants and Small Children Dose Estimates of Digibind® (in mg) From Steady-State Serum Digoxin Concentration

Patient Weight (kg)	Serum Digoxin Concentration (ng/mL)						
	1	**2**	**4**	**8**	**12**	**16**	**20**
1	0.4 mg[1]	1 mg[1]	1.5 mg[1]	3 mg[1]	5 mg	6 mg	8 mg
3	1 mg[1]	2 mg[1]	5 mg	9 mg	14 mg	18 mg	23 mg
5	2 mg[1]	4 mg	8 mg	15 mg	23 mg	30 mg	38 mg

10	4 mg	8 mg	15 mg	30 mg	46 mg	61 mg	76 mg
20	8 mg	15 mg	30 mg	61 mg	91 mg	122 mg	152 mg

[1] Dilution of reconstituted vial to 1 mg/mL may be desirable.

Alternatively, the following table gives an estimation of the amount of **DigiFab™** needed based on the steady-state serum digoxin concentration.

Infants and Small Children Dose Estimates of DigiFab™ (in mg) From Steady-State Serum Digoxin Concentration

Patient Weight (kg)	Serum Digoxin Concentration (ng/mL)						
	1	**2**	**4**	**8**	**12**	**16**	**20**
1	0.4 mg[1]	1 mg[1]	1.5 mg[1]	3 mg[1]	5 mg	6.5 mg	8 mg
3	1 mg[1]	2.5 mg[1]	5 mg	10 mg	14 mg	19 mg	24 mg
5	2 mg[1]	4 mg	8 mg	16 mg	24 mg	32 mg	40 mg
10	4 mg	8 mg	16 mg	32 mg	48 mg	64 mg	80 mg
20	8 mg	16 mg	32 mg	64 mg	96 mg	128 mg	160 mg

[1] Dilution of reconstituted vial to 1 mg/mL may be desirable.

Based on steady-state digitoxin concentration: Refer to adult dosing.

Chronic toxicity (serum digoxin concentration unavailable): I.V.: Infants and Children ≤20 kg: 1 vial is adequate to reverse most cases of toxicity

Dosing: Renal ImpairmentRenal elimination of complexed digoxin may be decreased in renal failure. Potential "rebound" may occur when immune fragments are hepatically metabolized, leaving unbound digoxin.
Administration: I.V.Continuous I.V. infusion over ≥30 minutes is preferred. May give by bolus injection if cardiac arrest is imminent. Small doses (infants/small children) may be administered using tuberculin syringe.
Administration: I.V. DetailStopping the infusion and restarting at a slower rate may help if infusion-related reactions occur.
StorageShould be refrigerated at 2°C to 8°C.
Reconstitution Digibind®: Reconstitute by adding 4 mL sterile water, resulting in 9.5 mg/mL for I.V. infusion. Reconstituted solutions should be used within 4 hours if refrigerated. For very small doses, reconstituted vial can be further diluted by adding an additional 34 mL of sterile isotonic saline to achieve a final concentration of 1 mg/mL.

DigiFab™: Reconstitute by adding 4 mL sterile water, resulting in 10 mg/mL for I.V. infusion. Reconstituted solutions should be used within 4 hours if refrigerated. For very small doses, reconstituted vial can be further diluted by adding an additional 36 mL of sterile isotonic saline to achieve a final concentration of 1 mg/mL.

ContraindicationsHypersensitivity to digoxin immune Fab, sheep products, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Hypersensitivity reactions can occur; immediate treatment (including epinephrine 1:1000) should be available.

Disease-related concerns:

- Heart failure: If digoxin was being used to treat heart failure, may see exacerbation of symptoms as digoxin level is reduced.
- Overdose: Consider other drug toxicities as well (eg, suicidal attempts often involve multiple drugs). Monitor for recurrence of digoxin toxicity.
- Renal impairment: Use with caution in patients with renal failure (experience limited); the complex will be removed from the body more slowly.

Dosage form specific issues:

- Papain: Processed with papain and may cause hypersensitivity reactions in patients allergic to papaya, other papaya extracts, papain, chymopapain, or the pineapple enzyme bromelain. There may also be cross allergy with dust mite and latex allergens.

Other warnings/precautions:

- Failure to respond to treatment: Failure of response to adequate treatment may call diagnosis of digitalis toxicity into question.

- Monitoring parameters: Serum potassium levels should be monitored, especially during the first few hours after administration. Total serum digoxin concentrations will rise precipitously following administration of this drug (has no clinical meaning; avoid monitoring serum concentrations).

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Safety and efficacy in pregnant women have not been established. Use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Effects (due to withdrawal of digitalis) include exacerbation of heart failure, rapid ventricular response in patients with atrial fibrillation; postural hypotension

Endocrine & metabolic: Hypokalemia

Local: Phlebitis

Miscellaneous: Allergic reactions, serum sickness

Drug InteractionsThere are no known significant interactions.
Test InteractionsDigibind® will interfere with digitalis immunoassay measurements - this will result in clinically misleading serum digoxin concentrations fragment is eliminated from the body (several days to >1 week after Digibind® administration).
Monitoring ParametersSerum potassium, serum digoxin concentration prior to first dose of digoxin immune Fab; **digoxin levels will greatly increase with digoxin immune Fab use and are not an accurate determination of body stores** (has no clinical meaning; avoid monitoring serum concentrations); standard digoxin concentration measurements may be misleading until Fab fragments are eliminated from the body.

Patients with renal failure should be monitored for a prolonged period for reintoxication with digoxin following the rerelease of bound digoxin into the blood.

Nursing: Physical Assessment/MonitoringAssess allergy history prior to administration. Assess results of laboratory tests, cardiac status, vital signs, blood pressure, and adverse reactions during and following infusion. Monitor for signs of reoccurrence of cardiac toxicity.
Monitoring: Lab TestsSerum potassium, serum digoxin concentration prior to first dose of digoxin immune Fab; **digoxin levels will greatly increase with digoxin immune Fab use and are not an accurate determination of body stores** (has no clinical meaning; avoid monitoring serum concentrations); standard digoxin concentration measurements may be misleading until Fab fragments are eliminated from the body.

Patients with renal failure should be monitored for a prolonged period for reintoxication with digoxin following the rerelease of bound digoxin into the blood.

Patient EducationPatient education and instruction will be determined by patient condition and ability to understand. Immediately report dizziness, palpitations, cramping, respiratory difficulty, rash, or itching. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [ovine derived]:

Digibind®: 38 mg [derived from or manufactured using papain]

DigiFab™: 40 mg [derived from or manufactured using papain]

Generic AvailableNo
ManufacturerGlaxoSmithKline
Mechanism of ActionDigoxin immune antigen-binding fragments (Fab) are specific antibodies for the treatment of digitalis intoxication in carefully selected patients; binds with molecules of digoxin or digitoxin and then is excreted by the kidneys and removed from the body
Pharmacodynamics/Kinetics

Onset of action: I.V.: Improvement in 2-30 minutes for toxicity

Half-life elimination: 15-20 hours; prolonged with renal impairment

Excretion: Urine; undetectable amounts within 5-7 days

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsAntidigoxin Fab Fragments, Ovine

Special Alerts

Digitek® (digoxin tablets, USP) Recalled (Actavis Totowa LLC) - April 28, 2008

Actavis Totowa LLC, manufacturer of Digitek® (digoxin) tablets, has initiated a voluntary recall of all lots of the tablets due to the possibility they may contain twice the amount of digoxin. The tablets may be double the appropriate thickness. Digitek® is distributed by Mylan and UDL under the Bertek and UDL labels (Mylan affiliates). To date there have been several recent reports of digoxin toxicity after taking the product.

Healthcare providers must be aware of the signs of digoxin toxicity which include anorexia, nausea, vomiting, dizziness, bradycardia, and heart block. Severe digoxin toxicity, if left untreated, may result in death. Patients at highest risk of digoxin toxicity include patients who have renal disease.

For more information, refer to the following: http://www.fda.gov/oc/po/firmrecalls/actavis04_08.html

Medication Safety Issues

Sound-alike/look-alike issues:

Digoxin may be confused with Desoxyn®, doxepin

Lanoxin® may be confused with Lasix®, Levoxyl®, Levsinex®, Lomotil®, Lonox®, Mefoxin®, Xanax®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

International issues:

Dilacor®: Brand name for diltiazem in the U.S.; brand name for verapamil in Brazil; brand name for barnidipine in Argentina

Lanoxin® may be confused with Lemoxin® which is a brand bane for cefuroxime in Mexico

Lanoxin® may be confused with Limoxin® which is a brand name for amoxicillin in Mexico

Pronunciation(di JOKS in)

U.S. Brand NamesDigitek®; Lanoxicaps® [DSC]; Lanoxin®

Canadian Brand NamesApo-Digoxin®; Digoxin CSD; Lanoxicaps®; Lanoxin®; Novo-Digoxin; Pediatric Digoxin CSD

Pharmacologic CategoryAntiarrhythmic Agent, Class IV; Cardiac Glycoside

Use: Labeled IndicationsTreatment of congestive heart failure and to slow the ventricular rate in tachyarrhythmias such as atrial fibrillation, atrial flutter, and supraventricular tachycardia (paroxysmal atrial tachycardia); cardiogenic shock

Dosing: Adults

Note: When changing from oral (tablets or liquid) or I.M. to I.V. therapy, dosage should be reduced by 20% to 25%.

Atrial dysrhythmias (rate control), CHF:

Initial: Total digitalizing dose: Give $^{1}/_{2}$ of the total digitalizing dose (TDD) in the initial dose, then give $^{1}/_{4}$ of the TDD in each of two subsequent doses at 6- to 8-hour intervals. Obtain ECG 6 hours after each dose to assess potential toxicity.

Oral: 0.75-1.5 mg

I.V. or I.M.: 0.5-1 mg

Daily maintenance dose: Give once daily to children >10 years of age and adults.

Oral: 0.125-0.5 mg

I.V. or I.M.: 0.1-0.4 mg

Dosing: ElderlyDose is based on lean body weight and normal renal function for age. Decrease dose in patients with decreased renal function (see Dosing in Renal Impairment).

Dosing: PediatricAtrial dysrhythmias (rate control), CHF: When changing from oral (tablets or liquid) or I.M. to I.V. therapy, dosage should be reduced by 20% to 25%. See table.

Dosage Recommendations for Digoxin

Age	Total Digitalizing Dose[2] (mcg/kg[1])		Daily Maintenance Dose[3] (mcg/kg[1])	
	P.O.	I.V. or I.M.	P.O.	I.V. or I.M.
Preterm infant[1]	20-30	15-25	5-7.5	4-6
Full-term infant[1]	25-35	20-30	6-10	5-8
1 mo - 2 y[1]	35-60	30-50	10-15	7.5-12
2-5 y[1]	30-40	25-35	7.5-10	6-9
5-10 y[1]	20-35	15-30	5-10	4-8
>10 y[1]	10-15	8-12	2.5-5	2-3

[1] Based on lean body weight and normal renal function for age. Decrease dose in patients with ↓ renal function; digitalizing dose often not recommended in infants and children.

[2] Give one-half of the total digitalizing dose (TDD) in the initial dose, then give one-quarter of the TDD in each of two subsequent doses at 6- to 8-hour intervals. Obtain ECG 6 hours after each dose to assess potential toxicity.

[3] Divided every 12 hours in infants and children <10 years of age. Given once daily to children >10 years of age and adults.

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer 25% to 75% of dose or every 36 hours.

Cl_{cr} <10 mL/minute: Administer 10% to 25% of dose or every 48 hours.

Reduce loading dose by 50% in ESRD.

Not dialyzable (0% to 5%)

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject no more than 2 mL per injection site. May cause intense pain.

Administration: I.V.May be administered undiluted or diluted fourfold in D_5W, NS, or SWFI for direct injection. Less than fourfold dilution may lead to drug precipitation. Inject slowly over ≥5 minutes

Administration: I.V. DetailpH: 6.8-7.2

Dietary ConsiderationsMaintain adequate amounts of potassium in diet to decrease risk of hypokalemia (hypokalemia may increase risk of digoxin toxicity).

StorageProtect elixir and injection from light.

CompatibilityStable in $D_5{}^1/_2NS$ with KCl 20 mEq, D_5W, $D_{10}W$, LR, ${}^1/_2NS$, and NS. May be diluted fourfold in D_5W, NS, or SWFI for direct injection (or may be administered undiluted).

Y-site administration: Compatible: Ciprofloxacin, cisatracurium, diltiazem, famotidine, gatifloxacin, heparin with hydrocortisone sodium succinate, inamrinone, linezolid, meperidine, meropenem, midazolam, milrinone, morphine, potassium chloride, remifentanil, tacrolimus, vitamin B complex with C. **Incompatible:** Amphotericin B cholesteryl sulfate complex, fluconazole, foscarnet, propofol. **Variable (consult detailed reference):** Insulin (regular).

Compatibility in syringe: Compatible: Heparin, milrinone. **Incompatible:** Doxapram.

Compatibility when admixed: Compatible: Bretylium, cimetidine, floxacillin, furosemide, lidocaine, ranitidine, verapamil. **Incompatible:** Dobutamine.

ContraindicationsHypersensitivity to digoxin or any component of the formulation; hypersensitivity to cardiac glycosides (another may be tried); history of toxicity; ventricular tachycardia or fibrillation; idiopathic hypertrophic subaortic stenosis; constrictive pericarditis; amyloid disease; second- or third-degree heart block (except in patients with a functioning artificial pacemaker); Wolff-Parkinson-White syndrome and atrial fibrillation concurrently

Allergy Considerations

- Digitalis Glycoside Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Proarrhythmic effects: Watch for proarrhythmic effects (especially with digoxin toxicity)

Disease-related concerns:

- Acute MI: Use with caution in patients with an acute MI (within 6 months).
- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.
- Heart failure (HF): Withdrawal in HF patients may lead to recurrence of HF symptoms.
- Hypermetabolic states: Atrial arrhythmias associated with hypermetabolic states are very difficult to treat.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment needed.
- Sinus nodal disease: Use with caution in patients with sinus nodal disease; may worsen.

Concurrent drug therapy issues:

- Amiodarone/quinidine/verapamil: Adjust dose when amiodarone, quinidine, or verapamil are added to a patient on digoxin.
- Calcium: Especially when administered rapidly I.V., calcium can produce serious arrhythmias in digitalized patients.

Other warnings/precautions:

- CAST trial: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide. An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.
- Elective electrical cardioversion: Reduce or hold dose 1-2 days before elective electrical cardioversion.
- Rate control: When using digoxin for rate control, it works best in a sedentary patient.
- Serum monitoring: Serum concentration monitoring should be done before the next dose (patient can hold AM dose for blood test) for an accurate assessment.

Geriatric ConsiderationsDigitalis preparations (primarily digoxin) are frequently used to treat common cardiac diseases in the elderly (congestive heart failure, atrial fibrillation). Elderly are at risk for toxicity due to age-related changes; volume of distribution is diminished significantly; half-life is increased as a result of decreased total body clearance. Additionally, elderly frequently have concomitant diseases which affect the pharmacokinetics in digitalis glycosides; hypo- and hyperthyroidism and renal function decline will affect clearance of digoxin. Exercise in elderly will reduce serum concentrations of digoxin due to increased skeletal muscle uptake. Therefore, a knowledge of the physical activity of elderly helps interpret serum assays. Must be observant for noncardiac signs of toxicity in elderly such as anorexia, vision changes (blurred), confusion, and depression. Changes in dose may be necessary with declining renal function with age; monitor closely.

Pregnancy Risk FactorC

LactationEnters breast milk (small amounts)/compatible

Adverse ReactionsIncidence not always reported.

Cardiovascular: Heart block; first-, second- (Wenckebach), or third-degree heart block; asystole; atrial tachycardia with block; AV dissociation; accelerated junctional rhythm; ventricular tachycardia or ventricular fibrillation; PR prolongation; ST segment depression

Central nervous system: Visual disturbances (blurred or yellow vision), headache (3%), dizziness (5%), apathy, confusion, mental disturbances (4%), anxiety, depression, delirium, hallucinations, fever

Dermatologic: Maculopapular rash (2%), erythematous, scarlatiniform, papular, vesicular or bullous rash, urticaria, pruritus, facial, angioneurotic or laryngeal edema, shedding of fingernails or toenails, alopecia

Gastrointestinal: Nausea (3%), vomiting (2%), diarrhea (3%), abdominal pain

Neuromuscular & skeletal: Weakness

<1% (Limited to important or life-threatening): Gynecomastia, thrombocytopenia, palpitation, unifocal or multiform ventricular premature contractions (especially bigeminy or trigeminy), anorexia, abdominal pain, intestinal ischemia, hemorrhagic necrosis of the intestines, increase plasma estrogen and decreased serum luteinizing hormone in men and postmenopausal women and decreased plasma testosterone in men, vaginal cornification, eosinophilia, sexual dysfunction, diaphoresis

Children are more likely to experience cardiac arrhythmia as a sign of excessive dosing. The most common are conduction disturbances or tachyarrhythmia (atrial tachycardia with or without block) and junctional tachycardia. Ventricular tachyarrhythmia are less common. In infants, sinus bradycardia may be a sign of digoxin toxicity. Any arrhythmia seen in a child on digoxin should be considered as digoxin toxicity. The gastrointestinal and central nervous system symptoms are not frequently seen in children.

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug Interactions

5-ASA Derivatives: May decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

Acarbose: May decrease the serum concentration of Digoxin. *Risk C: Monitor therapy*

Aminoglycosides: May decrease the absorption of Cardiac Glycosides. **Exceptions:** Amikacin; Gentamicin; Streptomycin; Tobramycin. *Risk C: Monitor therapy*

Aminoquinolines (Antimalarial): May increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Amiodarone: May increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Cardiac Glycosides. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antineoplastic Agents: May decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Alitretinoin; Altretamine; Aminoglutethimide; Anastrozole; Asparaginase; AzaCITIDine; Busulfan; Capecitabine; CARBOplatin; Chlorambucil; CISplatin; Cladribine; Cytarabine (Liposomal); Dacarbazine; DACTINomycin; DAUNOrubicin Citrate (Liposomal); DAUNOrubicin Hydrochloride; Denileukin Diftitox; Docetaxel; Epirubicin; Estramustine; Etoposide; Etoposide Phosphate; Exemestane; Fludarabine; Fluorouracil; Gemcitabine; Goserelin; Hydroxyurea; IDArubicin; Ifosfamide; Irinotecan; Letrozole; Leuprolide; Lomustine; Mechlorethamine; Megestrol; Mercaptopurine; Mitomycin; Mitotane; Mitoxantrone; Nilutamide; Paclitaxel; Pegaspargase; Pentostatin; Polyestradiol; Porfimer; RiTUXimab; Streptozocin; Tamoxifen; Temozolomide; Teniposide; Thioguanine; Thiotepa; Topotecan; Toremifene; Tretinoin (Oral); Valrubicin; VinBLAStine; Vinorelbine. *Risk C: Monitor therapy*

Antineoplastic Agents (Anthracycline): Cardiac Glycosides may diminish the cardiotoxic effect of Antineoplastic Agents (Anthracycline). Antineoplastic Agents (Anthracycline) may decrease the serum concentration of Cardiac Glycosides. The effects of liposomal formulations may be unique from those of the free drug, as liposomal formulation have unique drug disposition and toxicity profiles, and liposomes themselves may alter digoxin absorption/distribution. *Risk C: Monitor therapy*

Atorvastatin: May increase the serum concentration of Digoxin. *Risk C: Monitor therapy*

Beta-Blockers: May enhance the bradycardic effect of Cardiac Glycosides. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Cardiac Glycosides. **Exceptions:** Colesevelam. *Risk C: Monitor therapy*

Calcitriol: May enhance the arrhythmogenic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the AV-blocking effect of Cardiac Glycosides. Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Cardiac Glycosides. *Risk D: Consider therapy modification*

Carvedilol: May increase the serum concentration of Digoxin. *Risk C: Monitor therapy*

Conivaptan: May increase the serum concentration of Digoxin. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of Cardiac Glycosides. *Risk D: Consider therapy modification*

Kaolin: May decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

Macrolide Antibiotics: May increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Midodrine: Cardiac Glycosides may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nefazodone: May increase the serum concentration of Cardiac Glycosides. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: May enhance the arrhythmogenic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Penicillamine: May decrease the serum concentration of Digoxin. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May diminish the therapeutic effect of Cardiac Glycosides. Specifically, the inotropic effects. *Risk C: Monitor therapy*

Propafenone: May increase the serum concentration of Cardiac Glycosides. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

QuiNIDine: May increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

QuiNINE: May increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Ranolazine: May increase the serum concentration of Digoxin. *Risk C: Monitor therapy*

St Johns Wort: May decrease the serum concentration of Cardiac Glycosides. *Risk C: Monitor therapy*

Telmisartan: May increase the serum concentration of Cardiac Glycosides. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Digoxin peak serum levels may be decreased if taken with food. Meals containing increased fiber (bran) or foods high in pectin may decrease oral absorption of digoxin.

Herb/Nutraceutical: Avoid ephedra (risk of cardiac stimulation). Avoid natural licorice (causes sodium and water retention and increases potassium loss).

Monitoring Parameters

When to draw serum digoxin concentrations: Digoxin serum concentrations are monitored because digoxin possesses a narrow therapeutic serum range; the therapeutic endpoint is difficult to quantify and digoxin toxicity may be life-threatening. Digoxin serum levels should be drawn **at least 4 hours after an intravenous dose** and **at least 6 hours after an oral dose (optimally 12-24 hours after a dose).**

Initiation of therapy:

If a loading dose is given: Digoxin serum concentration may be drawn within 12-24 hours after the initial loading dose administration. Levels drawn this early may confirm the relationship of digoxin plasma levels and response but are of little value in determining maintenance doses.

If a loading dose is not given: Digoxin serum concentration should be obtained after 3-5 days of therapy.

Maintenance therapy:

Trough concentrations should be followed just prior to the next dose or at a minimum of 4 hours after an I.V. dose and at least 6 hours after an oral dose.

Digoxin serum concentrations should be obtained within 5-7 days (approximate time to steady-state) after any dosage changes. Continue to obtain digoxin serum concentrations 7-14 days after any change in maintenance dose. **Note:** In patients with end-stage renal disease, it may take 15-20 days to reach steady-state.

Additionally, patients who are receiving potassium-depleting medications such as diuretics, should be monitored for potassium, magnesium, and calcium levels.

Digoxin serum concentrations should be obtained whenever any of the following conditions occur:

Questionable patient compliance or to evaluate clinical deterioration following an initial good response

Changing renal function

Suspected digoxin toxicity

Initiation or discontinuation of therapy with drugs (amiodarone, quinidine, verapamil) which potentially interact with digoxin; if quinidine therapy is started, the digoxin dose should be reduced by 25% to 50% and digoxin levels should be monitored closely. Any disease changes (hypothyroidism)

Any disease changes (hypothyroidism)

Heart rate and rhythm should be monitored along with periodic ECGs to assess both desired effects and signs of toxicity

Follow closely (especially in patients receiving diuretics or amphotericin) for decreased serum potassium and magnesium or increased calcium, all of which predispose to digoxin toxicity

Assess renal function

Be aware of drug interactions

Observe patients for noncardiac signs of toxicity, confusion, and depression

Reference Range

Digoxin therapeutic serum concentrations:

Congestive heart failure: 0.5-0.8 ng/mL

Arrhythmias: 0.8-2 ng/mL

Adults: <0.5 ng/mL; probably indicates underdigitalization unless there are special circumstances

Toxic: >2.5 ng/mL

Digoxin-like immunoreactive substance (DLIS) may cross-react with digoxin immunoassay. DLIS has been found in patients with renal and liver disease, congestive heart failure, neonates, and pregnant women (3rd trimester).

Nursing: Physical Assessment/MonitoringClosely assess effects and interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests (when beginning or changing dosage, especially with I.V. administration and when patients are receiving diuretics or amphotericin). Monitor therapeutic effectiveness and adverse reactions at beginning of therapy, periodically throughout therapy, or when changing dosage. Monitor for signs of digoxin toxicity. **I.V.:** Monitor ECG continuously. **Oral:** Monitor apical pulse before administering any dose. Assess knowledge/teach patient appropriate use, adverse reactions to report, and appropriate interventions to reduce side effects.

Monitoring: Lab Tests

When to draw serum digoxin concentrations: Digoxin serum levels should be drawn **at least 4 hours after an intravenous dose** and **at least 6 hours after an oral dose (optimally 12-24 hours after a dose).**

Initiation of therapy:

If a loading dose is given: Digoxin serum concentration may be drawn within 12-24 hours after the initial loading dose administration. Levels drawn this early may confirm the relationship of digoxin plasma levels and response but are of little value in determining maintenance doses.

If a loading dose is not given: Digoxin serum concentration should be obtained after 3-5 days of therapy.

Maintenance monitoring:

Trough concentrations should be followed just prior to the next dose or at a minimum of 4 hours after an I.V. dose and at least 6 hours after an oral dose.

Digoxin serum concentrations should be obtained within 5-7 days (approximate time to steady-state) after any dosage changes. Continue to obtain digoxin serum concentrations 7-14 days after any change in maintenance dose. **Note:** In patients with end-stage renal disease, it may take 15-20 days to reach steady-state.

Patients who are receiving potassium-depleting medications such as diuretics, should be monitored for potassium, magnesium, and calcium levels.

Digoxin serum concentrations should be obtained whenever any of the following conditions occur:

Questionable patient compliance or to evaluate clinical deterioration following an initial good response

Changing renal function

Suspected digoxin toxicity

Initiation or discontinuation of therapy with drugs (amiodarone, quinidine, verapamil) which potentially interact with digoxin; if quinidine therapy is started, the digoxin dose should be reduced by 25% to 50% and digoxin levels should be monitored closely. Any disease changes (hypothyroidism)

Any disease changes (hypothyroidism)

Patient EducationTake as directed; do not discontinue without consulting prescriber. Maintain adequate dietary intake of potassium (do not increase without consulting prescriber). Adequate dietary potassium will reduce risk of digoxin toxicity. Take pulse at the same time each day, hold medication as directed by prescriber. Notify prescriber of acute changes in pulse. Report loss of appetite, nausea, vomiting, persistent diarrhea, swelling of extremities, palpitations, "yellowing" or blurred vision, mental confusion or depression, or unusual fatigue. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name; [DSC] = Discontinued product

Capsule:

Lanoxicaps®: 100 mcg [contains ethanol; DSC]; 200 mcg [contains ethanol; DSC]

Injection, solution: 250 mcg/mL (1 mL, 2 mL)

Lanoxin®: 250 mcg/mL (2 mL) [contains ethanol 10% and propylene glycol 40%]

Injection, solution [pediatric]: 100 mcg/mL (1 mL)

Solution, oral: 50 mcg/mL (2.5 mL, 5 mL, 60 mL)

Tablet: 125 mcg, 250 mcg

Digitek®, Lanoxin®: 125 mcg, 250 mcg

Apo-Digoxin® [CAN]: 62.5 mcg, 125 mcg, 250 mcg

Generic AvailableYes: Excludes capsule

Pricing: U.S. (www.drugstore.com)

Capsules (Lanoxicaps)

0.1 mg (100): $39.99

Tablets (Digoxin)

0.125 mg (30): $13.99

Tablets (Lanoxin)

0.125 mg (30): $19.99

0.25 mg (30): $17.99

Mechanism of Action

Congestive heart failure: Inhibition of the sodium/potassium ATPase pump which acts to increase the intracellular sodium-calcium exchange to increase intracellular calcium leading to increased contractility

Supraventricular arrhythmias: Direct suppression of the AV node conduction to increase effective refractory period and decrease conduction velocity - positive inotropic effect, enhanced vagal tone, and decreased ventricular rate to fast atrial arrhythmias. Atrial fibrillation may decrease sensitivity and increase tolerance to higher serum digoxin concentrations.

Pharmacodynamics/Kinetics

Onset of action: Oral: 1-2 hours; I.V.: 5-30 minutes

Peak effect: Oral: 2-8 hours; I.V.: 1-4 hours

Duration: Adults: 3-4 days both forms

Absorption: By passive nonsaturable diffusion in the upper small intestine; food may delay, but does not affect extent of absorption

Distribution:

Normal renal function: 6-7 L/kg

V_d: Extensive to peripheral tissues, with a distinct distribution phase which lasts 6-8 hours; concentrates in heart, liver, kidney, skeletal muscle, and intestines. Heart/serum concentration is 70:1. Pharmacologic effects are delayed and do not correlate well with serum concentrations during distribution phase.

Hyperthyroidism: Increased V_d

Hyperkalemia, hyponatremia: Decreased digoxin distribution to heart and muscle

Hypokalemia: Increased digoxin distribution to heart and muscles

Concomitant quinidine therapy: Decreased V_d

Chronic renal failure: 4-6 L/kg

Decreased sodium/potassium ATPase activity - decreased tissue binding

Neonates, full-term: 7.5-10 L/kg

Children: 16 L/kg

Adults: 7 L/kg, decreased with renal disease

Protein binding: 30%; in uremic patients, digoxin is displaced from plasma protein binding sites

Metabolism: Via sequential sugar hydrolysis in the stomach or by reduction of lactone ring by intestinal bacteria (in ~10% of population, gut bacteria may metabolize up to 40% of digoxin dose); metabolites may contribute to therapeutic and toxic effects of digoxin; metabolism is reduced with CHF

Bioavailability: Oral (formulation dependent): Elixir: 75% to 85%; Tablet: 70% to 80%

Half-life elimination (age, renal and cardiac function dependent):

Neonates: Premature: 61-170 hours; Full-term: 35-45 hours

Infants: 18-25 hours

Children: 35 hours

Adults: 38-48 hours

Adults, anephric: 4-6 days

Half-life elimination: Parent drug: 38 hours; Metabolites: Digoxigenin: 4 hours; Monodigitoxoside: 3-12 hours

Time to peak, serum: Oral: ~1 hour

Excretion: Urine (50% to 70% as unchanged drug)

Dental Health: Effects on Dental TreatmentSensitive gag reflex may cause difficulty in taking a dental impression.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse vasoconstrictor with caution due to risk of cardiac arrhythmias with digoxin

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentPhenytoin may decrease levels of digoxin; monitor levels

Cardiovascular ConsiderationsDigoxin has been used for many years in treatment of heart failure. Even though digoxin has a very narrow therapeutic index, it remains an important therapeutic strategy when added to standard therapy. When used in heart failure, it should be used only for systolic dysfunction and not diastolic dysfunction. While the long-term trials show no convincing reduction in cardiovascular mortality, digoxin therapy is associated with a decrease in frequency in hospitalizations for exacerbations of heart failure. A potential mechanism of benefit in heart failure is that digoxin may improve baroreflex sensitivity.

Digoxin use for ventricular rate control in patients with atrial fibrillation is a particularly useful strategy in those patients with coexisting systolic dysfunction. It is important to consider, however, that while digoxin may control ventricular response rate for atrial fibrillation at rest, the medication is less effective for rate control during exercise.

Digoxin toxicity may be potentiated in patients with hypokalemia, hypomagnesemia, and hypercalcemia. Digoxin may also rapidly approach toxic levels in patients with renal failure. For patients with renal failure, the loading dose is unchanged but maintenance doses may be adjusted and levels should be monitored very carefully. Signs of digoxin toxicity include both brady- and tachyarrhythmias. Bidirectional VT induced by digitalis toxicity indicates imminent development of ventricular fibrillation. The recent development of digoxin antibodies (Digibind®) allows rapid intervention for acute digoxin toxicity. However, it is important to note that after administration of Digibind®, measured digoxin levels cannot be used to follow effectiveness of antibody therapy because they seem to rise rapidly.

Anesthesia and Critical Care Concerns/Other ConsiderationsElderly are at risk for toxicity due to age-related changes; volume of distribution is diminished significantly; half-life is increased as a result of decreased total body clearance. Digoxin toxicity may be potentiated in patients with hypokalemia, hypomagnesemia, and hypercalcemia. Digoxin may also rapidly approach toxic levels in patients with renal failure. Signs of digoxin toxicity include both brady- and tachyarrhythmias. Bidirectional VT induced digitalis indicates imminent development of ventricular fibrillation.

Digoxin has been used for many years in treatment of heart failure. Digoxin therapy is associated with a decrease in frequency in hospitalizations for exacerbations of heart failure. Digoxin use for ventricular rate control in patients with atrial fibrillation is a particularly useful strategy in those patients with coexisting systolic dysfunction. While digoxin may control ventricular response rate for atrial fibrillation at rest, the medication is less effective for rate control during exercise.

Medication Safety Issues

Sound-alike/look-alike issues:

Synalgos®-DC may be confused with Synagis®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(dye hye droe KOE deen, AS pir in, & KAF een)

U.S. Brand NamesSynalgos®-DC

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsManagement of mild to moderate pain that requires relaxation

Use: DentalManagement of postoperative pain

Dosing: AdultsPain: Oral: 1-2 capsules every 4-6 hours as needed

Dosing: ElderlyInitial dosing should be cautious (low end of adult dosing range).

RestrictionsC-III

ContraindicationsHypersensitivity to dihydrocodeine or any component of the formulation; pregnancy (prolonged use or high doses at term)

Allergy Considerations

- Opioid Allergy/Hypersensitivity
- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).
- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.
- Tinnitus: Discontinue use if tinnitus or impaired hearing occurs.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- Bleeding disorders: Use with caution in patients with platelet and bleeding disorders.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Heavy ethanol use (>3 drinks/day) can increase bleeding risks.
- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer disease.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with severe renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other

obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Surgical patients: ASA should be avoided (if possible) in surgical patients for 1-2 weeks prior to surgery, to reduce the risk of excessive bleeding (except in patients with cardiac stents that have not completed their full course of dual antiplatelet therapy [aspirin, clopidogrel]; patient specific situations need to be discussed with cardiologist; AHA/ACC/SCAI/ACS/ADA Science Advisory provides recommendations).

Dosage form specific issues:

- Sulfites: Some preparations contain sulfites which may cause allergic reactions.

Other warnings/precautions:

- Alternative antitussive: Dextromethorphan has equivalent antitussive activity but has much lower toxicity in accidental overdose.

Pregnancy Risk FactorB/D (prolonged use or high doses at term)
LactationExcretion in breast milk unknown/use caution
Breast-Feeding Considerations

Acetaminophen: May be taken while breast-feeding.

Aspirin: Use cautiously due to potential adverse effects in nursing infants.

Dihydrocodeine: No data reported.

Adverse Reactions

>10%:

Central nervous system: Lightheadedness, dizziness, drowsiness, sedation

Dermatologic: Pruritus, skin reactions

Gastrointestinal: Nausea, vomiting, constipation

1% to 10%:

Cardiovascular: Hypotension, palpitation, bradycardia, peripheral vasodilation

Central nervous system: Increased intracranial pressure

Endocrine & metabolic: Antidiuretic hormone release

Gastrointestinal: Biliary tract spasm

Genitourinary: Urinary tract spasm

Ocular: Miosis

Respiratory: Respiratory depression

Miscellaneous: Histamine release, physical and psychological dependence with prolonged use

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor) based on dihydrocodeine
Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

QuiNIDine: May diminish the analgesic effect of Dihydrocodeine. *Risk D: Consider therapy modification*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Nursing: Physical Assessment/MonitoringSee individual agents for Aspirin and Caffeine.
Patient EducationSee individual agents for Aspirin and Caffeine.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: Dihydrocodeine bitartrate 16 mg, aspirin 356.4 mg, and caffeine 30 mg

Generic AvailableNo
Mechanism of ActionBinds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; causes cough suppression by direct central action in the medulla; produces generalized CNS depression
Pharmacodynamics/Kinetics

Onset of action: 10-30 minutes

Duration: 4-6 hours

Metabolism: Hepatic

Half-life elimination, serum: 3.8 hours

Time to peak, serum: 30-60 minutes

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin’s antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin’s platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin’s vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dihydrocodeine: nausea, followed by sedation and constipation. Elderly are a high-risk population for adverse effects from nonsteroidal anti-inflammatory agents. As many as 60% of elderly patients with GI complications from NSAIDs can develop peptic ulceration and/or hemorrhage asymptomatically. Concomitant disease and drug use contribute to the risk of GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age.

Aspirin: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common

Mental Health: Effects on Psychiatric TreatmentConcurrent use with MAO inhibitors may produce additive side effects

Cardiovascular ConsiderationsDihydrocodeine compound may cause constipation which may be problematic in patients with unstable angina, and patients after myocardial infarction. The hemodynamic responses to valsalva-like maneuvers due to straining may have adverse cardiovascular consequences in patients with critical coronary artery disease.

Index TermsDihydrocodeine Compound

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, “Infant Deaths Associated with Cough and Cold Medications - Two States, 2005,” *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Pronunciation(dye hye droe KOE deen, klor fen IR a meen, & fen il EF rin)

U.S. Brand NamesBaltussin; Coldcough PD; Novahistine DH

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of cough and congestion associated with the upper respiratory tract

Dosing: Adults**Cough and congestion:** Oral:

Baltussin: 5 mL every 4-6 hours as needed

Novahistine DH: 5-10 mL every 4-6 hours as needed (maximum: 40 mL/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cough and congestion:** Oral:

Children 2-6 years (Novahistine DH): 1.25-2.5 mL every 4-6 hours as needed (maximum: 10 mL/24 hours)

Children 6-12 years:

Baltussin: 2.5 mL every 4-6 hours as needed

Novahistine DH: 2.5-5 mL every 4-6 hours as needed (maximum: 20 mL/24 hours)

Children ≥12 years: Refer to adult dosing.

StorageStore at controlled room temperature.
RestrictionsC-III/C-V
ContraindicationsHypersensitivity to dihydrocodeine, chlorpheniramine, phenylephrine, codeine, sympathomimetic amines, antihistamines, or any component of the formulation; significant respiratory depression (in unmonitored settings), acute asthma, severe bronchial asthma, hypercapnia; paralytic ileus, peptic ulcer; use with or within 14 days of MAO inhibitors; severe hypertension, severe coronary artery disease; narrow angle glaucoma; urinary retention; pregnancy
Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients not able to maintain blood pressure.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (eg, hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease). Use is contraindicated with severe disease.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Delirium tremens: Use caution in patients with delirium tremens.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Respiratory disease: Use with caution in patients with pulmonary disease or decreased ventilatory function; dose-related respiratory depression occurs.
- Seizures: Use caution in patients with a history of seizure disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. This combination is contraindicated by some manufacturers during pregnancy. Also See individual monographs for codeine, chlorpheniramine, and phenylephrine.
LactationExcretion in breast milk unknown/use caution

Adverse ReactionsSee individual agents.

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May diminish the analgesic effect of Dihydrocodeine. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsSee individual monographs for Codeine, Chlorpheniramine, and Phenylephrine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid:

Novahistine DH: Dihydrocodeine bitartrate 7.5 mg, chlorpheniramine maleate 2 mg and phenylephrine hydrochloride 5 mg per 5 mL (480 mL) [alcohol free, sugar free; contains propylene glycol; strawberry flavor; C-III]

Syrup:

Baltussin: Dihydrocodeine bitartrate 3 mg, chlorpheniramine maleate 5 mg, and phenylephrine hydrochloride 20 mg per 5 mL (480 mL) [alcohol free, sugar free; contains propylene glycol; fruit flavor; C-III]

Coldcough PD: Dihydrocodeine bitartrate 3 mg, chlorpheniramine maleate 2 mg, and phenylephrine hydrochloride 7.5 mg per 5 mL (120 mL) [alcohol free, sugar free; grape flavor; C-V]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Syrup (Pancof PD)

7.5-2-3 mg/5 mL (480): $94.99

Mechanism of Action

Dihydrocodeine: Binds to opiate receptors in the CNS; suppresses cough in medullary center; produces generalized CNS depression

Chlorpheniramine: Competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract

Phenylephrine: Potent, direct-acting alpha-adrenergic stimulator with weak beta-adrenergic activity; causes vasoconstriction of the arterioles of the nasal mucosa and conjunctiva

Related Information

- Chlorpheniramine
- Codeine
- Phenylephrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:
Chlorpheniramine: Prolonged use will cause significant xerostomia (normal salivary flow resumes upon discontinuation).

Phenylephrine: Up to 10% of patients could experience tachycardia, palpitations, and xerostomia; use vasoconstrictor with caution.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause paradoxical excitation in pediatric patients. Sedation is common; may cause anxiety, euphoria, confusion, insomnia, nervousness, fatigue, hallucinations, or depression.

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitors. Concomitant use with psychotropics may produce additive sedation or hypotensive effects. May result in loss of pain control if used with fluoxetine or paroxetine.

Index TermsChlorpheniramine Maleate, Dihydrocodeine Bitartrate, and Phenylephrine Hydrochloride; Phenylephrine, Chlorpheniramine, and Dihydrocodeine

Dihydrocodeine, Pseudoephedrine, and Guaifenesin

Special Alerts

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#cough

Pronunciation(dye hye droe KOE deen, soo doe e FED rin, & gwye FEN e sin)

U.S. Brand NamesDiHydro-GP; Hydro-Tussin™ EXP [DSC]; Pancof®-EXP

Pharmacologic CategoryAntitussive/Decongestant/Expectorant

Use: Labeled IndicationsTemporary relief of cough and congestion associated with upper respiratory tract infections and allergies

Dosing: Adults

Cough/congestion: Oral (Hydro-Tussin™ EXP, Pancof®-EXP): 5-10 mL every 4-6 hours as needed

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Cough/congestion: Oral (Hydro-Tussin™ EXP, Pancof®-EXP): Children:

2-6 years: 1.25-2.5 mL every 4-6 hours as needed

6-12 years 2.5-5 mL every 4-6 hours as needed

≥12 years: Refer to adult dosing.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to dihydrocodeine, codeine, pseudoephedrine, guaifenesin, or any component of the formulation; severe respiratory depression; acute asthma or hypercapnia; paralytic ileus; severe hypertension; severe cardiac disease; narrow-angle glaucoma; bronchial asthma; urinary retention; peptic ulcer; use with or within 14 days of MAO inhibitors; pregnancy

Allergy Considerations

- GuaiFENesin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pulmonary disease or decrease ventilatory function; dose-related respiratory depression occurs.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Use with caution in children; may be more sensitive to adverse effects. Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.

Geriatric ConsiderationsElderly may be particularly susceptible to CNS depression and confusion, as well as the constipating effects of narcotics. Elderly are more predisposed to adverse effects of sympathomimetics since they frequently have cardiovascular disease and diabetes, as well as multiple drug therapies.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Refer to individual monographs for Codeine, Pseudoephedrine, and Guaifenesin for additional information. Use during pregnancy is contraindicated.

Breast-Feeding ConsiderationsRefer to individual monographs for Codeine, Pseudoephedrine, and Guaifenesin.

Adverse ReactionsRefer to individual agents.

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

QuiNIDine: May diminish the analgesic effect of Dihydrocodeine. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Test InteractionsRefer to individual monographs for Pseudoephedrine and Guaifenesin.

Nursing: Physical Assessment/MonitoringSee individual agents for Pseudoephedrine and Guaifenesin.

Patient EducationSee individual agents for Pseudoephedrine and Guaifenesin.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Syrup:

DiHydro-GP: Dihydrocodeine bitartrate 7.5 mg, pseudoephedrine hydrochloride 15 mg, and guaifenesin 100 mg per 5 mL (480 mL) [vanilla flavor]

Hydro-Tussin™ EXP [DSC], Pancof®-EXP: Dihydrocodeine bitartrate 7.5 mg, pseudoephedrine hydrochloride 15 mg, and guaifenesin 100 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free]

Generic AvailableYes

Mechanism of Action

Dihydrocodeine is an antitussive and analgesic chemically related to codeine. Codeine binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; causes cough supression by direct central action in the medulla; produces generalized CNS depression.

Pseudoephedrine directly stimulates alpha-adrenergic receptors of respiratory mucosa causing vasoconstriction; directly stimulates beta-adrenergic receptors causing bronchial relaxation, increased heart rate and contractility.

Guaifenesin is thought to act as an expectorant by irritating the gastric mucosa and stimulating respiratory tract secretions, thereby increasing respiratory fluid volumes and decreasing phlegm viscosity.

Related Information

- Codeine
- GuaiFENesin
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDizziness, nervousness, and insomnia are common; may cause CNS depression; concomitant use with psychotropic agents may produce additive effects; may rarely cause hallucinations

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor use

Index TermsGuaifenesin, Dihydrocodeine, and Pseudoephedrine; Pseudoephedrine Hydrochloride, Guaifenesin, and Dihydrocodeine Bitartrate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(dye hye droe er GOT a meen)

U.S. Brand NamesD.H.E. 45®; Migranal®

Canadian Brand NamesMigranal®

Pharmacologic CategoryAntimigraine Agent; Ergot Derivative

Use: Labeled IndicationsTreatment of migraine headache with or without aura; injection also indicated for treatment of cluster headaches

Use: Unlabeled/InvestigationalAdjunct for DVT prophylaxis for hip surgery, for orthostatic hypotension, xerostomia secondary to antidepressant use, and pelvic congestion with pain

Dosing: Adults

Migraine, cluster headache:

I.M., SubQ: 1 mg at first sign of headache; repeat hourly to a maximum dose of 3 mg total; maximum dose: 6 mg/week

I.V.: 1 mg at first sign of headache; repeat hourly up to a maximum dose of 2 mg total; maximum dose: 6 mg/week

Intranasal: 1 spray (0.5 mg) of nasal spray should be administered into each nostril; if needed, repeat after 15 minutes, up to a total of 4 sprays. **Note:** Do not exceed 3 mg (6 sprays) in a 24-hour period and no more than 8 sprays in a week.

Dosing: ElderlyRefer to adult dosing. Patients >65 years of age were not included in controlled clinical studies.

Dosing: Renal ImpairmentContraindicated in severe renal impairment

Dosing: Hepatic ImpairmentDosage reductions are probably necessary but specific guidelines are not available; contraindicated in severe hepatic dysfunction.

Administration: OtherPrior to administration of nasal spray, the nasal spray applicator must be primed (pumped 4 times); in order to let the drug be absorbed through the skin in the nose, patients should not inhale deeply through the nose while spraying or immediately after spraying; for best results, treatment should be initiated at the first symptom or sign of an attack; however, nasal spray can be used at any stage of a migraine attack

Storage

Injection: Store below 25°C (77°F); do not refrigerate or freeze. Protect from heat and light.

Nasal spray: Prior to use, store below 25°C (77°F); do not refrigerate or freeze. Once spray applicator has been prepared, use within 8 hours; discard any unused solution.

ContraindicationsHypersensitivity to dihydroergotamine or any component of the formulation; high-dose aspirin therapy; uncontrolled hypertension, ischemic heart disease, angina pectoris, history of MI, silent ischemia, or coronary artery vasospasm including Prinzmetal's angina; hemiplegic or basilar migraine; peripheral vascular disease; sepsis; severe hepatic or renal dysfunction; following vascular surgery; avoid use within 24 hours of sumatriptan, zolmitriptan, other serotonin agonists, or ergot-like agents; avoid during or within 2 weeks of discontinuing MAO inhibitors; ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); pregnancy

Allergy Considerations

- Ergot Alkaloid Allergy

Warnings/Precautions

Boxed warnings:

- CYP3A4 inhibitors: See “Concurrent drug therapy issues” below.

Concerns related to adverse effects:

- Cardiac valvular fibrosis: Ergot alkaloids have been associated with fibrotic valve thickening (eg, aortic, mitral, tricuspid); usually associated with long-term, chronic use.
- Cardiovascular effects: Vasospasm or vasoconstriction can occur, possibly resulting in decreased cerebral blood flow, ECG changes, and hypertension; sustained vasoconstriction may also lead to ischemic colitis, intermittent claudication, aggravation of angina, or precipitation of MI. Do not use is any patient at risk or predisposed to vascular effects of ergot alkaloids.
- Cerebrovascular events: Cerebral hemorrhage, subarachnoid hemorrhage, and stroke have also occurred (in some cases resulted in fatalities) following use of the injection.
- Ergotism: Ergot alkaloid use may result in ergotism (intense vasoconstriction) resulting in peripheral vascular ischemia and possible gangrene. Ergotism is usually associated with overdosage or prolonged chronic use; do not exceed dosing guidelines and avoid prolonged administration.

- Pleural/retroperitoneal fibrosis: Rare cases of pleural and/or retroperitoneal fibrosis have been reported with prolonged daily use.

Disease-related concerns:

- Cardiovascular disease: Do not give to patients with risk factors for CAD until a cardiovascular evaluation has been performed; if evaluation is satisfactory, the healthcare provider should administer the first dose and cardiovascular status should be periodically evaluated.

Concurrent drug therapy issues:

- CYP3A4 inhibitors: **[U.S. Boxed Warning]: Ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); concomitant use associated with acute ergot toxicity (ergotism).**

Special populations:

- Elderly: Use with extreme caution or avoid use in the elderly; due to vasoconstrictive properties and cardiovascular adverse effects associated with ergot alkaloids.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Migranal® Nasal Spray: Local irritation to nose and throat (usually transient and mild-moderate in severity) can occur; long-term consequences on nasal or respiratory mucosa have not been extensively evaluated.

Geriatric ConsiderationsMonitor cardiac and peripheral effects closely in the elderly since they often have cardiovascular disease and peripheral vascular impairment (ie, diabetes mellitus, PVD) that will complicate therapy and monitoring for adverse effects.

Pregnancy Risk FactorX

Pregnancy ConsiderationsDihydroergotamine is oxytocic and should not be used during pregnancy.

LactationMay be excreted in breast milk/contraindicated

Breast-Feeding ConsiderationsErgot derivatives inhibit prolactin and it is known that ergotamine is excreted in breast milk (vomiting, diarrhea, weak pulse, and unstable blood pressure have been reported in nursing infants). It is not known if dihydroergotamine would also cause these effects, however, it is likely that it is excreted in human breast milk. Do not use in nursing women.

Adverse Reactions

>10%: Nasal spray: Respiratory: Rhinitis (26%)

1% to 10%: Nasal spray:

Central nervous system: Dizziness (4%), somnolence (3%)

Endocrine & metabolic: Hot flashes (1%)

Gastrointestinal: Nausea (10%), taste disturbance (8%), vomiting (4%), diarrhea (2%)

Local: Application site reaction (6%)

Neuromuscular & skeletal: Weakness (1%), stiffness (1%)

Respiratory: Pharyngitis (3%)

<1% (Limited to important or life-threatening): Injection and nasal spray: Abdominal pain, anxiety, cerebral hemorrhage, coronary artery vasospasm, cramps, diaphoresis increased, diarrhea, dizziness, edema, flushing, headache, hyperkinesis, hypertension, muscular weakness, myalgia, MI, myocardial ischemia, palpitation, paresthesia, peripheral ischemia, peripheral cyanosis, rash, stroke, subarachnoid hemorrhage, transient ventricular tachycardia, tremor, ventricular fibrillation

Postmarketing and/or case reports: Injection: Pleural and retroperitoneal fibrosis have been reported following prolonged use; cardiac valvular fibrosis has been associated with ergot alkaloids

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)

Drug Interactions

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Efavirenz: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Macrolide Antibiotics: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Posaconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Protease Inhibitors: May decrease the metabolism of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: Ergot Derivatives may enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Ergot Derivatives. This may cause serotonin syndrome. *Risk X: Avoid combination*

Voriconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Reference RangeMinimum concentration for vasoconstriction is reportedly 0.06 ng/mL

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic response and adverse effects on a regular basis. Teach patient proper use for either nasal spray or injection (storage, administration, injection technique, and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to women of childbearing age, unless patient is capable of complying with contraceptive use.

Patient EducationTake this drug as rapidly as possible when first symptoms occur. May cause rare feelings of numbness or tingling of fingers, toes, or face (use caution and avoid injury) or drowsiness (use caution when driving or engaging in potentially hazardous tasks until response to drug is known). Report heart palpitations, severe nausea or vomiting, and severe numbness of fingers or toes.

Nasal spray: Follow directions for use on package insert. Wait 15 minutes between inhalations. Use no more than 4 inhalations (2 mg) for a single administration; do not use >3 mg (6 sprays) in a 24-hour period and no more than 8 sprays in a week.

I.M.: Follow directions for injections and needle disposal.

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as mesylate: 1 mg/mL (1 mL) [contains ethanol 6.2%]

Pricing: U.S. (www.drugstore.com)

Solution (D.H.E. 45)

1 mg/mL (5): $369.30

Solution (Migranal)

4 mg/mL (4): $119.99

Mechanism of ActionErgot alkaloid alpha-adrenergic blocker directly stimulates vascular smooth muscle to vasoconstrict peripheral and cerebral vessels; also has effects on serotonin receptors

Pharmacodynamics/Kinetics

Onset of action: 15-30 minutes

Duration: 3-4 hours

Distribution: V_d: 14.5 L/kg

Protein binding: 93%

Metabolism: Extensively hepatic

Half-life elimination: 1.3-3.9 hours

Time to peak, serum: I.M.: 15-30 minutes

Excretion: Primarily feces; urine (10% mostly as metabolites)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Rhinitis and abnormal taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsUse is contraindicated in patients with cardiovascular disease because of its potent vasoconstrictor action. Administration may elicit marked increases in blood pressure and cardiac, cerebral, or peripheral vascular ischemia. Long-term use (injectable) has resulted in cardiac valvular fibrosis.

Index TermsDHE; Dihydroergotamine Mesylate

International Brand NamesAdhaegon (AT); Cervasal (BG); Dergott (JP); Detemes Retard (AT); Detms (LU); DH-Ergotamin (PL); DHE (IN); DHT (AR); Diergospray (FR); Dihydergot (AU, BE, BF, BJ, BR, CH, CI, CZ, DE, ES, ET, GH, GM, GN, GR, ID, IL, IN, KE, LR, LU, MA, ML, MR, MU, MW, NE, NG, NL, NO, PE, SC, SD, SL, SN, TN, TR, TZ, UG, VE, ZA, ZM, ZW); Dihydergot Sandoz (AT); Dihydroergotamin "Dak" (DK); Dihydroergotaminum Methansulfonicum (PL); Dihydroergotaminum Tartaricum (PL); Ditamin (HR, PL); Dystonal (BE); Ergotamina (PY); Ergovasan (AT); Ikaran (FR, IT, LU, PT); Ikaran LP (FR); Migranal (GB); Neomigran (HU, PL); Orstanorm (FI, SE); Parsel (MX); Seglor (AR, FR, IT, LU, TW); Seglor Retard (PT); Tamik (FR); Tenuatina (ES); Tonopan (MX); Verladyn (DE); Verteblan (GR)

Dihydrotachysterol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(dye hye droe tak ISS ter ole)
U.S. Brand NamesDHT™ Intensol™ [DSC]; DHT™ [DSC]; Hytakerol® [DSC]
Canadian Brand NamesHytakerol®
Pharmacologic CategoryVitamin D Analog
Use: Labeled IndicationsTreatment of hypocalcemia associated with hypoparathyroidism; prophylaxis of hypocalcemic tetany following thyroid surgery
Dosing: Adults

Hypoparathyroidism: Oral: Initial: 0.8-2.4 mg/day for several days followed by maintenance doses of 0.2-1 mg/day

Nutritional rickets: Oral: 0.5 mg as a single dose or 13-50 mcg/day until healing occurs

Renal osteodystrophy: Oral: Maintenance: 0.25-0.6 mg/24 hours adjusted as necessary to achieve normal serum calcium levels and promote bone healing

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricHypoparathyroidism: Oral:

Infants and young Children: Initial: 1-5 mg/day for 4 days, then 0.1-0.5 mg/day

Older Children: Refer to adult dosing.

StorageProtect from light.
ContraindicationsHypersensitivity to dihydrotachysterol or any component of the formulation; hypercalcemia; pregnancy (dose exceeding RDA)
Warnings/Precautions

Concerns related to adverse effects:

- Hypercalcemia: Use is contraindicated in patients with hypercalcemia.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease.
- Renal impairment: Use with caution in patients with decreased renal function (especially with secondary hyperparathyroidism) or renal stones.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Calcium-phosphate product: Serum calcium and phosphorus product must not exceed 70.

Geriatric ConsiderationsRecommended daily allowances (RDA) have not been developed for persons >65 years of age; vitamin D, folate, and B_{12} (cyanocobalamin) have decreased absorption with age, but the clinical significance is yet unknown. Calorie requirements decrease with age and therefore, nutrient density must be increased to ensure adequate nutrient intake, including vitamins and minerals. Therefore, the use of a daily supplement with a multiple vitamin with minerals is recommended. Elderly consume less vitamin D, absorption may be decreased, and many elderly have decreased sun exposure; therefore, elderly should receive supplementation with 800 units of vitamin D (20 mcg)/day. This is a recommendation of particular need to those with high risk for osteoporosis.
Pregnancy Risk FactorA/D (dose exceeding RDA recommendation)
LactationEnters breast milk/compatible
Adverse Reactions

>10%:

Endocrine & metabolic: Hypercalcemia

Renal: Serum creatinine increased, hypercalciuria

<1%: Convulsions, polydipsia, nausea, vomiting, anorexia, weight loss, polyuria, anemia, weakness, metastatic calcification, renal damage

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersMonitor renal function, serum calcium, and phosphate concentrations; if hypercalcemia is encountered, discontinue agent until serum calcium returns to normal

Reference RangeCalcium (serum): 9-10 mg/dL (4.5-5 mEq/L)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, effectiveness of therapy, and adverse effects at beginning of therapy and regularly with long-term use. Assess knowledge/teach patient appropriate use, appropriate nutritional counseling, possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab TestsRenal function, serum calcium, and phosphate concentrations. If hypercalcemia is encountered, discontinue agent until serum calcium returns to normal.

Patient EducationTake exact dose prescribed; do not take more than recommended. Your prescriber may recommend a special diet. Do not increase calcium intake without consulting prescriber. Avoid magnesium supplements or magnesium-containing antacids. You may experience nausea, vomiting, or metallic taste (small frequent meals, frequent mouth care, or sucking hard candy may help); or hypotension (use caution when rising from sitting or lying position or when climbing stairs or bending over). Report chest pain or palpitations; acute headache, dizziness, or feeling of weakness; unresolved nausea or vomiting; persistent metallic taste; unrelieved muscle or bone pain; or CNS irritability. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule (Hytakerol®): 0.125 mg [contains sesame oil] [DSC]

Solution, oral concentrate (DHT™ Intensol™): 0.2 mg/mL (30 mL) [contains alcohol 20%] [DSC]

Tablet (DHT™): 0.125 mg, 0.2 mg, 0.4 mg [DSC]

Generic AvailableNo

Mechanism of ActionSynthetic analogue of vitamin D with a faster onset of action; stimulates calcium and phosphate absorption from the small intestine, promotes secretion of calcium from bone to blood; promotes renal tubule resorption of phosphate

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Calcium: 2-4 weeks

Duration: ≤9 weeks

Absorption: Well absorbed

Distribution: Stored in liver, fat, skin, muscle, and bone

Excretion: Feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConcurrent use with phenytoin or phenobarbital may decrease effectiveness

Index TermsDichysterol

Diltiazem

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Cardizem® may be confused with Cardene®, Cardene SR®, Cardizem CD®, Cardizem SR®, cardiem

Cartia XT™ may be confused with Procardia XL®

Diltiazem may be confused with Dilantin®

Tiazac® may be confused with Tigan®, Tiazac® XC [CAN], Ziac®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

International issues:

Cardizem® may be confused with Cardem® which is a brand name for celiprolol in Spain

Cartia XT™ may be confused with Cartia® which is a brand name for aspirin in multiple international markets

Dilacor®: Brand name for digoxin in Serbia, a brand name for verapamil in Brazil, and a brand name for barnidipine in Argentina

Tiazac® may be confused with Tazac® which is a brand name for nizatidine in Australia

Tiazac® may be confused with Tiazac® XC which is a brand name for diltiazem available in Canada (not available in U.S.)

Pronunciation(dil TYE a zem)

U.S. Brand NamesCardizem®; Cardizem® CD; Cardizem® LA; Cartia XT™; Dilacor® XR; Dilt-CD; Dilt-XR; Taztia XT™; Tiazac®

Canadian Brand NamesAlti-Diltiazem CD; Apo-Diltiaz CD®; Apo-Diltiaz SR®; Apo-Diltiaz TZ®; Apo-Diltiaz®; Apo-Diltiaz® Injectable; Cardizem®; Cardizem® CD; Cardizem® SR; Diltiazem HCl ER®; Diltiazem Hydrochloride Injection; Gen-Diltiazem; Gen-Diltiazem CD; Med-Diltiazem; Novo-Diltazem; Novo-Diltazem-CD; Novo-Diltiazem HCl ER; Nu-Diltiaz; Nu-Diltiaz-CD; ratio-Diltiazem CD; Rhoxal-diltiazem CD; Rhoxal-diltiazem SR; Rhoxal-diltiazem T; Sandoz-Diltiazem CD; Sandoz-Diltiazem T; Syn-Diltiazem®; Tiazac® ; Tiazac® XC

Pharmacologic CategoryCalcium Channel Blocker

Use: Labeled Indications

Oral: Essential hypertension; chronic stable angina or angina from coronary artery spasm

Injection: Atrial fibrillation or atrial flutter; paroxysmal supraventricular tachycardia (PSVT)

Use: Unlabeled/InvestigationalInvestigational: Therapy of Duchenne muscular dystrophy

Dosing: Adults

Angina: Oral:

Capsule, extended release (Cardizem® CD, Cartia XT™, Dilacor® XR, Tiazac®): Initial: 120-180 mg once daily (maximum dose: 480 mg/day)

Tablet, extended release (Cardizem® LA, Tiazac® XC [CAN; not available in U.S.]): 180 mg once daily; may increase at 7- to 14-day intervals (maximum recommended dose: 360 mg/day)

Tablet, immediate release (Cardizem®): Usual starting dose: 30 mg 4 times/day; usual range: 180-360 mg/day

Hypertension: Oral:

Capsule, extended release (Cardizem® CD, Cartia XT™, Dilacor® XR, Tiazac®): Initial: 180-240 mg once daily; dose adjustment may be made after 14 days; usual dose range (JNC 7): 180-420 mg/day; Tiazac®: usual dose range: 120-540 mg/day

Capsule, sustained release: Initial: 60-120 mg twice daily; dose adjustment may be made after 14 days; usual range: 240-360 mg/day

Tablet, extended release (Cardizem® LA, Tiazac® XC [CAN; not available in U.S.]): Initial: 180-240 mg once daily; dose adjustment may be made after 14 days; usual dose range (JNC 7): 120-540 mg/day

Atrial fibrillation, atrial flutter, PSVT: I.V.:

Initial bolus dose: 0.25 mg/kg actual body weight over 2 minutes (average adult dose: 20 mg)

Repeat bolus dose (may be administered after 15 minutes if the response is inadequate): 0.35 mg/kg actual body weight over 2 minutes (average adult dose: 25 mg)

Continuous infusion (requires an infusion pump; infusions >24 hours or infusion rates >15 mg/hour are not recommended): Initial infusion rate of 10 mg/hour; rate may be increased in 5 mg/hour increments up to 15 mg/hour as needed; some patients may respond to an initial rate of 5 mg/hour.

If diltiazem injection is administered by continuous infusion for >24 hours, the possibility of decreased diltiazem clearance, prolonged elimination half-life, and increased diltiazem and/or diltiazem metabolite plasma concentrations should be considered.

Conversion from I.V. diltiazem to oral diltiazem:

Oral dose (mg/day) is approximately equal to [rate (mg/hour) x 3 + 3] x 10.

3 mg/hour = 120 mg/day

5 mg/hour = 180 mg/day

7 mg/hour = 240 mg/day

11 mg/hour = 360 mg/day

Dosing: ElderlyRefer to adult dosing. **Note:** Patients ≥60 years may respond to a lower initial dose (eg, 120 mg once daily using extended release capsule)

Dosing: Pediatric

Children: Minimal information available; some centers use the following:

Hypertension (unlabeled use): Oral: Initial: 1.5-2 mg/kg/day in 3 divided doses (maximum: 6 mg/kg/day, up to 360 mg/day)

Note: Doses up to 8 mg/kg/day given in 4 divided doses have been used for investigational therapy of Duchenne muscular dystrophy

Adolescents: Refer to adult dosing.

Dosing: Renal ImpairmentUse with caution as diltiazem is extensively metabolized by the liver and excreted in the kidneys and bile. Not removed by hemo- or peritoneal dialysis; supplemental dose is not necessary.

Dosing: Hepatic ImpairmentUse with caution as diltiazem is extensively metabolized by the liver and excreted in the kidneys and bile.

Calculations

- Diltiazem

Administration: I.V.Bolus doses given over 2 minutes with continuous ECG and blood pressure monitoring. Continuous infusion should be via infusion pump.

Administration: I.V. DetailResponse to bolus may require several minutes to reach maximum. Response may persist for several hours after infusion is discontinued.

pH: 3.7-4.1

Administration: OralDo not crush long acting dosage forms.

Taztia XT™, Tiazac®: Capsules may be opened and sprinkled on a spoonful of applesauce. Applesauce should be swallowed without chewing, followed by drinking a glass of water.

Tiazac® XC [CAN; not available in U.S.]: Administer at bedtime

Storage

Capsule, tablet: Store at 15°C to 30°C (59°F to 86°F). Protect from light.

Solution for injection: Store in refrigerator at 2°C to 8°C (36°F to 46°F). May be stored at room temperature for up to 1 month; do not freeze. Following dilution with $D_5$1/2NS, D_5W, or NS, solution is stable for 24 hours at room temperature or under refrigeration.

CompatibilityStable in $D_5{}^1/_2$NS, D_5W, NS.

Y-site administration: Compatible: Albumin, amikacin, amphotericin B, aztreonam, bretylium, bumetanide, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, digoxin, dobutamine, dopamine, doxycycline, epinephrine, erythromycin lactobionate, esmolol, fentanyl, fluconazole, gentamicin, hetastarch, hydromorphone, imipenem/cilastatin, labetalol, lidocaine, lorazepam, meperidine, metoclopramide, metronidazole, midazolam, milrinone, morphine, multivitamins, nicardipine, nitroglycerin, norepinephrine, oxacillin, penicillin G potassium, pentamidine, piperacillin, potassium chloride, potassium phosphates, ranitidine, sodium nitroprusside, theophylline, ticarcillin, ticarcillin/clavulanate potassium, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium. **Incompatible:** Diazepam, furosemide, phenytoin, rifampin, thiopental. **Variable (consult detailed reference):** Acetazolamide, acyclovir, aminophylline, ampicillin, ampicillin/sulbactam, cefamandole, cefoperazone, heparin, hydrocortisone sodium succinate, insulin (regular), methylprednisolone sodium succinate, nafcillin, procainamide, sodium bicarbonate.

Extemporaneously PreparedA 12 mg/mL oral liquid preparation made from tablets (regular, not sustained release) and 3 different vehicles (cherry syrup, a 1:1 mixture of Ora-Sweet® and Ora-Plus®, or a 1:1 mixture of Ora-Sweet® SF and Ora-Plus®) was stable for 60 days when stored in amber plastic prescription bottles in the dark at room temperature (25°C) or under refrigeration (5°C); grind sixteen 90 mg tablets in a mortar into a fine powder; add 10 mL of the vehicle and mix well to form a uniform paste; mix while adding the vehicle in geometric proportions to **almost** 120 mL; transfer to a calibrated bottle and qs ad with vehicle to 120 mL; label “shake well” and “protect from light”.

Allen LV and Erickson MA, “Stability of Baclofen, Captopril, Diltiazem Hydrochloride, Dipyridamole, and Flecainide Acetate in Extemporaneously Compounded Oral Liquids,” *Am J Health Syst Pharm*, 1996, 53(18):2179-84.

Contraindications

Oral: Hypersensitivity to diltiazem or any component of the formulation; sick sinus syndrome; second- or third-degree AV block (except in patients with a functioning artificial pacemaker); severe hypotension (systolic <90 mm Hg); acute MI and pulmonary congestion

Intravenous (I.V.): Hypersensitivity to diltiazem or any component of the formulation; sick sinus syndrome; second- or third-degree AV block (except in patients with a functioning artificial pacemaker); severe hypotension (systolic <90 mm Hg); acute MI and pulmonary congestion; administration concomitantly or within a few hours of the administration of I.V. beta-blockers; atrial fibrillation or flutter associated with accessory bypass tract (eg, Wolff-Parkinson-White syndrome); ventricular tachycardia (with wide-complex tachycardia, must determine whether origin is supraventricular or ventricular)

Canadian labeling: Additional contraindications (not in U.S. labeling): I.V. and oral: Pregnancy; use in women of childbearing potential

Allergy Considerations

- Diltiazem Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Conduction abnormalities: May cause first-, second-, and third-degree AV block or sinus bradycardia; risk increases with agents known to slow cardiac conduction.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition.
- Peripheral edema: The most common side effect is peripheral edema; occurs within 2-3 weeks of starting therapy.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; may require lower starting dose.
- Hypertrophic obstructive cardiomyopathy (HOCM): Use with caution in patients with HOCM.
- Left ventricular dysfunction: Use with caution in left ventricular dysfunction; due to negative inotropic effects, may exacerbate condition.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy:

- Beta-blockers: Concomitant use with beta-blockers can result in conduction disturbances, hypotension, and worsened LV function; I.V. administration concomitantly or within a few hours of I.V. beta-blockers is contraindicated.
- Digoxin: Concomitant use with digoxin can result in conduction disturbances.

Geriatric ConsiderationsElderly may experience a greater hypotensive response; constipation may be encountered more often in elderly. Calcium channel blockers are no more effective in elderly than other therapies; however, they do not cause significant CNS effects which is an advantage over other antihypertensive agents (eg, beta-blockers, clonidine).

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic and embryotoxic effects have been demonstrated in small animals. There are no adequate and well-controlled studies in pregnant women.

LactationEnters breast milk/not recommended (AAP considers “compatible”)

Breast-Feeding ConsiderationsFreely diffuses into breast milk; however, the AAP considers diltiazem to be **compatible** with breast-feeding. Available evidence suggests safe use during breast-feeding.

Adverse Reactions**Note:** Frequencies represent ranges for various dosage forms. Patients with impaired ventricular function and/or conduction abnormalities may have higher incidence of adverse reactions.

>10%:

Cardiovascular: Edema (2% to 15%)

Central nervous system: Headache (5% to 12%)

2% to 10%:

Cardiovascular: AV block (first degree 2% to 8%), edema (lower limb, 2% to 8%), pain (6%), bradycardia (2% to 6%), hypotension (<2% to 4%), vasodilation (2% to 3%), extrasystoles (2%), flushing (1% to 2%), palpitation (1% to 2%)

Central nervous system: Dizziness (3% to 10%), nervousness (2%)

Dermatologic: Rash (1% to 4%)

Endocrine & metabolic: Gout (1% to 2%)

Gastrointestinal: Dyspepsia (1% to 6%), constipation (<2% to 4%), vomiting (2%), diarrhea (1% to 2%)

Local: Injection site reactions: Burning, itching (4%)

Neuromuscular & skeletal: Weakness (1% to 4%), myalgia (2%)

Respiratory: Rhinitis (<2% to 10%), pharyngitis (2% to 6%), dyspnea (1% to 6%), bronchitis (1% to 4%), sinus congestion (1% to 2%)

<2%: Albuminuria, alkaline phosphatase increased, allergic reaction, ALT increased, AST increased, amblyopia, amnesia, angina, anorexia, arrhythmia, AV block (second or third degree), bruising, bundle branch block, CHF, CPK increased, crystalluria, depression, dreams abnormal, dry mouth, dysgeusia, ECG abnormalities, epistaxis, gait abnormality, gynecomastia, hallucination, hyperglycemia, hyperuricemia, impotence, insomnia, LDH increased, muscle cramps, nausea, neck rigidity, nocturia, pain, paresthesia, personality change, petechiae, photosensitivity, polyuria, pruritus, somnolence, syncope, tachycardia, thirst, tinnitus, tremor, ventricular extrasystoles, weight gain

Postmarketing and/or case reports: Alopecia, angioedema, asystole, bleeding time increased, erythema multiforme, exfoliative dermatitis, extrapyramidal symptoms, gingival hyperplasia, hemolytic anemia, leukopenia, purpura, retinopathy, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis

Metabolism/Transport Effects **Substrate** of CYP2C9 (minor), 2D6 (minor), 3A4 (major); **Inhibits** CYP2C9 (weak), 2D6 (weak), 3A4 (moderate)

Drug Interactions

Alfentanil: Diltiazem may increase the serum concentration of Alfentanil. *Risk C: Monitor therapy*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amiodarone: Calcium Channel Blockers (Nondihydropyridine) may enhance the bradycardic effect of Amiodarone. Sinus arrest has been reported. *Risk D: Consider therapy modification*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Calcium Channel Blockers (Nondihydropyridine). Anilidopiperidine Opioids may enhance the hypotensive effect of Calcium Channel Blockers (Nondihydropyridine). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Diltiazem. Diltiazem may increase the serum concentration of Aprepitant. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Beta-Blockers: Calcium Channel Blockers (Nondihydropyridine) may enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

BusPIRone: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Calcium Channel Blockers (Nondihydropyridine) may enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of CarBAMazepine. CarBAMazepine may increase the metabolism of Calcium Channel Blockers (Nondihydropyridine). *Risk D: Consider therapy modification*

Cardiac Glycosides: Calcium Channel Blockers (Nondihydropyridine) may enhance the AV-blocking effect of Cardiac Glycosides. Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Cardiac Glycosides. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Colestipol: May decrease the absorption of Diltiazem. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of CycloSPORINE. CycloSPORINE may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eletriptan: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Eletriptan. *Risk C: Monitor therapy*

Eplerenone: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Diltiazem. The active metabolite aprepitant is likely responsible for this effect. Diltiazem may increase the serum concentration of Fosaprepitant. Specifically, diltiazem may increase the concentration of the active metabolite aprepitant. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Lithium: Calcium Channel Blockers (Nondihydropyridine) may enhance the neurotoxic effect of Lithium. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Lithium. Decreased or unaltered lithium concentrations have also been reported with this combination. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Calcium Channel Blockers (Nondihydropyridine) may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of QuiNIDine. *Risk D: Consider therapy modification*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Ranolazine: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: Calcium Channel Blockers (Nondihydropyridine) may enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Tacrolimus: Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Tacrolimus. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of hypotension or vasodilation).

Food: Diltiazem serum levels may be elevated if taken with food. Serum concentrations were not altered by grapefruit juice in small clinical trials.

Herb/Nutraceutical: St John's wort may decrease diltiazem levels. Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice, yohimbe (may worsen hypertension). Avoid black cohosh, California poppy, coleus, garlic, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersLiver function tests, blood pressure, ECG

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions (eg, increased risk of bradycardia, conduction delays, decreased cardiac output). I.V. requires use of infusion pump and continuous cardiac and hemodynamic monitoring. Assess therapeutic effectiveness according to purpose for use (hypertension, angina, atrial fib/flutter or PSVT) and adverse reactions when beginning therapy, when changing dose, and periodically during long-term therapy. Teach patient appropriate use (oral), interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLiver function tests

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Oral: Take as directed; do not alter dosage or discontinue therapy without consulting prescriber. Do not crush or chew extended release form. Avoid (or limit) alcohol and caffeine. May cause dizziness or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report chest pain, palpitations, irregular heartbeat; unusual cough, respiratory difficulty; swelling of extremities; muscle tremors or weakness; confusion or acute lethargy; skin rash; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule, extended release, as hydrochloride [once-daily dosing]: 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg

Cardizem® CD: 120 mg, 180 mg, 240 mg, 300 mg, 360 mg

Cartia XT™: 120 mg, 180 mg, 240 mg, 300 mg

Dilacor® XR, Dilt-XR: 120 mg, 180 mg, 240 mg

Dilt-CD: 120 mg, 180 mg, 240 mg, 300 mg

Taztia XT™: 120 mg, 180 mg, 240 mg, 300 mg, 360 mg

Tiazac®: 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg

Capsule, extended release, as hydrochloride [twice-daily dosing]: 60 mg, 90 mg, 120 mg

Injection, solution, as hydrochloride: 5 mg/mL (5 mL, 10 mL, 25 mL)

Injection, powder for reconstitution, as hydrochloride: 100 mg

Tablet, as hydrochloride: 30 mg, 60 mg, 90 mg, 120 mg

Cardizem®: 30 mg, 60 mg, 90 mg, 120 mg

Tablet, extended release, as hydrochloride:

Cardizem® LA: 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg

Tiazac® XC [CAN; not available in U.S.]: 120 mg, 180 mg, 240 mg, 300 mg, 360 mg

Generic AvailableYes: Excludes extended release tablet

120 mg (90): $29.99

Mechanism of ActionInhibits calcium ion from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization, producing a relaxation of coronary vascular smooth muscle and coronary vasodilation; increases myocardial oxygen delivery in patients with vasospastic angina

Pharmacodynamics/Kinetics

Onset of action: Oral: Immediate release tablet: 30-60 minutes

Absorption: Immediate release tablet: >90%; Extended release capsule: ~93%

Distribution: V_d: 3-13 L/kg

Protein binding: 70% to 80%

Metabolism: Hepatic; extensive first-pass effect; following single I.V. injection, plasma concentrations of N-monodesmethyldiltiazem and desacetyldiltiazem are typically undetectable; however, these metabolites accumulate to detectable concentrations following 24-hour constant rate infusion. N-monodesmethyldiltiazem appears to have 20% of the potency of diltiazem; desacetyldiltiazem is about 25% to 50% as potent as the parent compound.

Bioavailability: Oral: ~40% (undergoes extensive first-pass metabolism)

Half-life elimination: Immediate release tablet: 3-4.5 hours, may be prolonged with renal impairment; Extended release tablet: 6-9 hours; Extended release capsules: 5-10 hours

Time to peak, serum: Immediate release tablet: 2-4 hours; Extended release tablet: 11-18 hours; Extended release capsule: 10-14 hours

Excretion: Urine (2% to 4% as unchanged drug; 6% to 7% as metabolites); feces

Related Information

- Antiarrhythmic Drugs
- Calcium Channel Blockers
- Hypertension

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Diltiazem has been reported to cause >10% incidence of gingival hyperplasia; usually disappears with discontinuation (consultation with physician is suggested).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, nervousness, or sedation

Mental Health: Effects on Psychiatric TreatmentMay produce leukopenia; use caution with clozapine and carbamazepine; lithium levels may be increased or decreased; monitor serum lithium levels; benzodiazepines (midazolam, triazolam), buspirone, and carbamazepine levels may be increased; monitor for increased side effects

Cardiovascular ConsiderationsDiltiazem is an effective antihypertensive alone or in combination with other agents. Antihypertensive therapy should be individualized with consideration given to the patient's concomitant diseases and compelling indications for therapy.

In the treatment of acute myocardial infarction, diltiazem may be used to treat hypertension or ongoing ischemia if beta-blocker therapy is ineffective or contraindicated and in the absence of left ventricular dysfunction, pulmonary congestion, or AV block. In this setting, diltiazem may be beneficial. Diltiazem should be avoided in patients with left ventricular dysfunction or pulmonary congestion.

Diltiazem may be administered intravenously in the acute setting to attain ventricular rate control in patients with atrial fibrillation or flutter. Patients who respond, defined in general as at least a 20% decrease in ventricular response rate or attaining a rate <100 beats/minute, can be continued on oral therapy to maintain control. It is important to consider the potential drug interaction with digoxin, as these agents are both used in this setting.

In the treatment of unstable angina/non-ST-segment elevation MI, a nondihydropyridine calcium antagonist (diltiazem or verapamil) may be considered in patients with continuing or frequently recurring ischemia when beta-blockers are contraindicated (Class I). Oral long-acting calcium antagonists may also be considered in addition to beta-blockers and nitrates (Class IIa).

Anesthesia and Critical Care Concerns/Other ConsiderationsDiltiazem may be administered intravenously in the acute setting to attain ventricular rate control in patients with atrial fibrillation or flutter. Patients who respond, defined in general as at least a 20% decrease in ventricular response rate or attaining a rate <100 beats/minute, can be continued on oral therapy to maintain control.

Index TermsDiltiazem Hydrochloride

DimenhyDRINATE

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

DimenhyDRINATE may be confused with diphenhydrAMINE

Pronunciation(dye men HYE dri nate)

U.S. Brand NamesDramamine® [OTC]; Driminate® [OTC]; TripTone® [OTC]

Canadian Brand NamesApo-Dimenhydrinate®; Children's Motion Sickness Liquid; Dinate®; Gravol®; Jamp® Travel Tablet; Nauseatol; Novo-Dimenate; SAB-Dimenhydrinate

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTreatment and prevention of nausea, vertigo, and vomiting associated with motion sickness

Dosage forms available in Canada (not available in the U.S.), including parenteral formulations and suppositories, are also approved for the treatment of postoperative nausea and vomiting and treatment of radiation sickness.

Use: Unlabeled/InvestigationalTreatment of Meniere's disease

Dosing: Adults

Motion sickness (prevention/treatment): Oral: 50-100 mg every 4-6 hours, not to exceed 400 mg/day

Gravol® L/A (not available in the U.S.): Oral: 75-150 mg every 8-12 hours, up to a maximum of five 75 mg caplets or three 100 mg caplets in 24 hours

Additional formulations/uses (approved in Canada) for parenteral/suppository formulations (not available in U.S.):

Postoperative nausea and vomiting: I.M., I.V., rectal: 50-100 mg administered 30-60 minutes prior to radiation therapy; may be repeated as needed up to a maximum of 400 mg in 24 hours

Radiation sickness: I.M., I.V., rectal: 50-100 mg administered 30-60 minutes prior to radiation therapy. May be repeated as needed up to a maximum of 400 mg in 24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricMotion sickness (prevention/treatment): Oral:

2-5 years: 12.5-25 mg every 6-8 hours, maximum: 75 mg/day

6-12 years: 25-50 mg every 6-8 hours, maximum: 150 mg/day

Dietary ConsiderationsMay be taken with food or water.

ContraindicationsHypersensitivity to dimenhydrinate or any component

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or angle-closure glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Antihistamines may cause excitation in young children. Not for OTC use in children <2 years of age.

Dosage form specific issues:

- Parenteral formulations: (Not available in the U.S.): Intended for I.V. and I.M. use are distinct and should not be confused. The I.M. formulation can be used for I.V. administration only after dilution.

- Phenylalanine: Some products may contain phenylalanine.

- Tartrazine: Some products may contain tartrazine.

Geriatric Considerations

Monitor for anticholinergic side effects (confusion, constipation, etc); if possible, limit use to short-term therapy

Pregnancy Risk FactorB

Adverse Reactions

>10%:

Central nervous system: Slight to moderate drowsiness

Respiratory: Thickening of bronchial secretions

1% to 10%:

Central nervous system: Dizziness, fatigue, headache, nervousness

Gastrointestinal: Abdominal pain, diarrhea, increased appetite, nausea, weight gain, xerostomia

Neuromuscular & skeletal: Arthralgia

Respiratory: Pharyngitis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule, softgel (Gravol®) [CAN]: 50 mg [not available in the U.S.]

Capsule, long-acting (Gravol® L/A) [CAN]: 75 mg, 100 mg [not available in the U.S.]

Injection, solution: 50 mg/mL (1 mL)

Tablets (Triptone)

50 mg (30): $8.99

Mechanism of ActionCompetes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract; blocks chemoreceptor trigger zone, diminishes vestibular stimulation, and depresses labyrinthine function through its central anticholinergic activity
Pharmacodynamics/Kinetics

Onset of action: Oral: ~15-30 minutes

Absorption: Oral: Well absorbed

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDrowsiness is common; may cause depression, nervousness, or paradoxical CNS stimulation
Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropic may result in additive sedation
International Brand NamesAgolene (BE); Amosyt (SE); Anautin (DK, EC); Antemin (CH); Antivomit (FI); Aviomarin (PL); Biodramina (CR, ES, GT, PA, SV); Cinfamar (ES, TW); Contramareo (ES); Daedalon (HU); Dekatravel (BE); Denim (TH); Devom (PK); Dimenate (HK, MY); Dimenhidrinato (MX); Dimenidrinato (IT); Dimicaps (MX); Dimin (TH); Divonal (PE); Dramamine (AR, AU, BB, BD, BF, BJ, BM, BS, BZ, CI, CL, ET, GH, GM, GN, GY, HK, ID, IN, JM, JP, KE, KP, LR, MA, ML, MR, MU, MW, MY, NE, NG, NL, PH, PK, PR, SC, SD, SG, SL, SN, SR, TH, TN, TT, TW, TZ, UG, VE, ZA, ZM, ZW); Dramamine (BE, GB, IE, LU, MX); Dramasan (PE); Dramavir (ES); Dramin (BR); Dramina (HR); Driminate Supp (MY); Dromyl (NO); Emedyl (AT); Garcol (HK); Gravol (CR, DO, GT, HK, IN, NI, PA, PE, PH, SV, TH); Hydrinate (MY); Lomarin (IT); Mareol (CO); Mareosan (ES); Marolin (ES); Menito (TW); Motozina (IT); Nausamine (TH); Nausicalm (FR); Novomin (HK, MY); Paranausine (BE, LU); Pasedol (CO); Phrachedi (TH); RubieMen (DE); Setmenate (HK); Travamin (IL); Travel Well (ES); Travel-Gum (AT, CZ, IT); Trawell (CH); Trimin (TW); Vagomine (BE, LU); Valontan (ES, IT); Vertirosan (AT); Vomidrine (PT); Vomisin (MX); Votmine (MY); Xamamina (IT)

Dimercaprol

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(dye mer KAP role)

U.S. Brand NamesBAL in Oil®

Pharmacologic CategoryAntidote

Use: Labeled IndicationsAntidote to gold, arsenic (except arsine), or acute mercury poisoning (except nonalkyl mercury); adjunct to edetate CALCIUM disodium in lead poisoning

Dosing: Adults**Note:** Premedication with a histamine H_1 antagonist (eg, diphenhydramine) is recommended.

Mild arsenic or gold poisoning: Deep I.M.: 2.5 mg/kg every 6 hours for 2 days, then every 12 hours for 1 day, followed by once daily for 10 days

Severe arsenic or gold poisoning: Deep I.M.: 3 mg/kg every 4 hours for 2 days, then every 6 hours for 1 day, followed every 12 hours for 10 days

Mercury poisoning: Deep I.M.: 5 mg/kg initially, followed by 2.5 mg/kg 1-2 times/day for 10 days

Lead poisoning: Deep I.M.: **Note:** For the treatment of high blood lead levels in children, the CDC recommends chelation treatment when blood lead levels are >45 mcg/dL (CDC, 2002). Combination parenteral therapy is indicated when blood lead levels are ≥70 mcg/dL, or patients are symptomatic (AAP, 2005). In adults, available guidelines recommend chelation therapy with blood lead levels >50 mcg/dL and significant symptoms; chelation therapy may also be indicated with blood lead levels ≥100 mcg/dL and/or symptoms. (Kosnett, 2007).

Lead encephalopathy (in conjunction with edetate CALCIUM disodium): Dimercaprol 4 mg/kg (75 mg/m^2) loading dose, followed by dimercaprol 4 mg/kg (75 mg/m^2) every 4 hours for 2-7 days (edetate CALCIUM disodium is **not** administered with the loading dose; begin edetate CALCIUM disodium with the second dose)

Symptomatic lead poisoning or blood lead levels ≥70 mcg/dL (in conjunction with edetate CALCIUM disodium): Dimercaprol 4 mg/kg (75 mg/m^2) loading dose, followed by dimercaprol 3 mg/kg/dose (50 mg/m^2) every 4 hours for 2-7 days (edetate CALCIUM disodium is **not** administered with the loading dose; begin edetate CALCIUM disodium with the second dose)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Premedication with a histamine H_1 antagonist (eg, diphenhydramine) is recommended. Refer to adult dosing.

Administration: I.M.Administer all injections deep I.M. at different sites. Keep urine alkaline to protect renal function. When used in the treatment of lead poisoning, administer in a separate site from edetate CALCIUM disodium.

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHepatic insufficiency (unless due to arsenic poisoning); iron, cadmium, or selenium poisoning

Warnings/Precautions

Concerns related to adverse effects:

- Nephrotoxicity: Potentially a nephrotoxic drug; use with caution in patients with oliguria. Keep urine alkaline to protect kidneys (prevents dimercaprol-metal complex breakdown). Discontinue or use with extreme caution if renal insufficiency develops during treatment. Hemodialysis may be used to remove dimercaprol-metal chelate in patients with renal dysfunction

Special populations:

- Glucose 6-phosphate dehydrogenase deficiency: Use with caution in patients with glucose 6-phosphate dehydrogenase deficiency; may increase risk of hemolytic anemia.

- Pediatrics: Fevers may occur in ~30% of children and may persist for the duration of therapy.

Disease related concerns:

- Lead poisoning: Investigate, identify, and remove sources of lead exposure prior to treatment.

- Heavy metal poisoning: Primary care providers should consult experts in chemotherapy of heavy metal toxicity before using chelation drug therapy.

Dosage form specific issues:

- Peanut oil: Product contains peanut oil; use with caution in patients with peanut allergy; medication for the treatment of hypersensitivity reactions should be available for immediate use.

Other warnings/precautions:

- Administration: Administer all injections deep I.M. at different sites.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. There are no adequate and well-controlled studies in pregnant women.

Lead poisoning: Following maternal occupational exposure, lead was found to cross the placenta in amounts related to maternal plasma levels. Possible outcomes of maternal lead exposure >10 mcg/dL include spontaneous abortion, postnatal developmental delay, and reduced birth weight. Chelation therapy during pregnancy is for maternal benefit only and should be limited to the treatment of severe, symptomatic lead poisoning.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding Considerations

It is not known if dimercaprol is excreted in breast milk; however, it is not absorbed orally, which would limit the exposure to a nursing infant. When used for the treatment of lead poisoning, the amount of lead in breast milk may range from 0.6% to 3% of the maternal serum concentration. Calcium supplementation may reduce the amount of lead in breast milk.

Adverse Reactions

Frequency not always defined.

Cardiovascular: Chest pain, hypertension (dose related), tachycardia (dose related)

Central nervous system: Anxiety, fever (children ~30%), headache, nervousness

Dermatologic: Abscess

Gastrointestinal: Abdominal pain, burning sensation (lips, mouth, throat), nausea, salivation, throat irritation/pain, vomiting

Genitourinary: Burning sensation (penis)

Hematologic: Leukopenia (polymorphonuclear)

Local: Injection site pain

Neuromuscular & skeletal: Paresthesias (hand), weakness

Ocular: Blepharospasm, conjunctivitis, lacrimation

Renal: Acute renal insufficiency

Respiratory: Rhinorrhea, throat constriction

Miscellaneous: Diaphoresis

Drug Interactions

Iron Salts: Dimercaprol may enhance the nephrotoxic effect of Iron Salts. *Risk X: Avoid combination*

Test InteractionsIodine ^{131}I thyroidal uptake values may be decreased

Monitoring ParametersRenal function, urine pH, infusion-related reactions

For lead poisoning: Blood lead levels (baseline and 7-21 days after completing chelation therapy); hemoglobin or hematocrit, iron status, free erythrocyte protoporphyrin or zinc protoporphyrin; neurodevelopmental changes

Monitoring: Lab TestsRenal function, urine pH

For lead poisoning: Blood lead levels (baseline and 7-21 days after completing chelation therapy); hemoglobin or hematocrit, iron status, free erythrocyte protoporphyrin or zinc protoporphyrin; neurodevelopmental changes

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, oil:

BAL in Oil®: 100 mg/mL (3 mL) [contains benzyl benzoate and peanut oil]

Generic AvailableNo

Mechanism of ActionSulfhydryl group combines with ions of various heavy metals to form relatively stable, nontoxic, soluble chelates which are excreted in urine

Pharmacodynamics/Kinetics

Absorption: I.M.: Rapid; Oral: Not absorbed

Distribution: To all tissues including the brain

Metabolism: Rapidly hepatic to inactive metabolites

Time to peak, serum: 0.5-1 hour

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness

Mental Health: Effects on Psychiatric TreatmentMay produce neutropenia; use caution with clozapine and carbamazepine

Index Terms BAL; British Anti-Lewisite; Dithioglycerol

Dimethyl Sulfoxide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(dye meth il sul FOKS ide)

U.S. Brand NamesRimso-50®

Canadian Brand NamesDimethyl Sulfoxide Irrigation, USP; Kemsol®; Rimso-50®

Pharmacologic CategoryUrinary Tract Product

Use: Labeled IndicationsSymptomatic relief of interstitial cystitis

Dosing: AdultsInterstitial cystitis: Instill 50 mL directly into bladder and allow to remain for 15 minutes; repeat every 2 weeks until symptoms are relieved, then increase intervals between treatments **or** 50 mL directly into bladder for 15-20 minutes every 1-2 weeks for 4-8 treatments (Chancellor, 2004)

Dosing: ElderlyRefer to adult dosing.

Administration: Other**Not for I.V. or I.M. use.** Intravesical: Instill directly into the bladder via catheter or syringe. To reduce bladder spasm it is recommended to apply an analgesic lubricant (eg, lidocaine jelly) to urethra prior to catheter insertion; belladonna and opium suppositories may be of benefit.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsThere are no contraindications listed within the manufacturer's labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: May cause hypersensitivity reactions (rare).
- Ophthalmic effects: Lens changes and opacities have been observed in animal studies; precaution is advised in humans and eye exams (prior to use and periodically) are recommended.

Disease-related concerns:

- Urinary tract malignancy: Use with caution in patients with urinary tract malignancy; may be harmful due to vasodilatory effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate administration: For bladder instillation only; do not administer I.V./I.M.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Gastrointestinal: Garlic-like breath (may persist for up to 72 hours), garlic-like taste (may persist for several hours)

Genitourinary: Cystitis (transient)

Local: Discomfort (moderate-to-severe)

Miscellaneous: Skin odor (may persist for up to 72 hours)

Postmarketing and/or case reports: Contact dermatitis, eosinophilic cystitis, hypersensitivity reactions, lens deposits

Drug Interactions

Sulindac: Dimethyl Sulfoxide may decrease the metabolism of Sulindac. Specifically, the concentrations of the active sulfide metabolite are decreased. *Risk C: Monitor therapy*

Monitoring ParametersCBC, liver and renal function tests about every 6 months; eye examinations and slit lamp examinations (baseline and periodically)

Nursing: Physical Assessment/MonitoringFor bladder instillation only. Assess knowledge/teach patient interventions to reduce side effects and adverse symptoms to report.

Monitoring: Lab TestsCBC, liver and renal function tests about every 6 months

Patient EducationThis medication is only for use as a bladder instillation. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Report persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Note breast-feeding caution.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, intravesical:

Rimso-50®: 50% [500 mg/mL] (50 mL)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Rimso-50)

50% (50): $111.20

Mechanism of ActionExact mechanism unknown; reported to induce and alter inflammatory tissue responses, modulate collagen disposition, influence nerve conduction and neurotransmission, and alter cell proliferation in fibroblasts and hepatocytes; thus exerting an anti-inflammatory, analgesic, and muscle relaxant effect. It may also interact with free radicals forming formaldehyde, possibly contributing to fixative effect on biological tissues.

Pharmacodynamics/Kinetics

Absorption: Well absorbed (topical administration)

Distribution: Body fluids and tissues (topical administration)

Metabolism: Oxidation to dimethyl sulfone; reduction to dimethyl sulfide

Excretion: Urine and feces (as unchanged drug and dimethyl sulfone); skin and lungs (dimethyl sulfoxide)

Pharmacotherapy PearlsDimethyl sulfoxide (≥99%) is used as a cryopreservative solution.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsDMSO

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Prepidil® may be confused with Bepridil®

International issues:

Cervidil®: Brand name for gemeprost in Italy

Pronunciation(dye noe PROST one)

U.S. Brand NamesCervidil®; Prepidil®; Prostin E_2®

Canadian Brand NamesCervidil®; Prepidil®; Prostin E_2®

Pharmacologic CategoryAbortifacient; Prostaglandin

Use: Labeled Indications

Gel: Promote cervical ripening in patients at or near term in whom there is a medical or obstetrical indication for the induction of labor

Suppositories: Terminate pregnancy from 12th through 20th week of gestation; evacuate uterus in cases of missed abortion or intrauterine fetal death up to 28 weeks of gestation; manage benign hydatidiform mole (nonmetastatic gestational trophoblastic disease)

Vaginal insert: Initiation and/or continuation of cervical ripening in patients at or near term in whom there is a medical or obstetrical indication for the induction of labor

Dosing: Adults

Abortifacient:*Vaginal suppository:* Insert 20 mg (1 suppository) high in vagina, repeat at 3- to 5-hour intervals until abortion occurs; continued administration for longer than 2 days is not advisable

Cervical ripening:

Endocervical gel: Using catheter supplied with gel, insert 0.5 mg into the cervical canal. May repeat every 6 hours if needed. Maximum cumulative dose: 1.5 mg/24 hours

Vaginal insert: Insert 10 mg transversely into the posterior fornix of the vagina (to be removed at the onset of active labor or after 12 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricFemales of reproductive age: Refer to adult dosing.

Administration: Other

Endocervical gel: Bring to room temperature just prior to use. Do not force the warming process (eg, water bath, microwave). Avoid contact with skin while handling; wash hands thoroughly with soap and water after administration. For cervical ripening, patient should be supine in the dorsal position. The appropriate catheter length should be based on degree of effacement; 20 mm for no effacement; 10 mm if 50% effaced. Patient should remain supine for 15-30 minutes following administration.

Vaginal insert: One vaginal insert is placed transversely in the posterior fornix of the vagina immediately after removal from its foil package. Patients should remain in the recumbent position for 2 hours after insertion, but thereafter may be ambulatory. Do not use without retrieval system. Product does not need warmed prior to use. A water miscible lubricant may be used to facilitate insertion (avoid excessive use of lubricant). Ensure complete removal of system at completion of therapy.

Vaginal suppository: Bring to room temperature just prior to use. Patient should remain supine for 10 minutes following insertion.

StorageSuppositories must be kept frozen; store in freezer not above -20°C (-4°F). Cervical gel should be stored under refrigeration 2°C to 8°C (36°F to 46°F). Vaginal insert should be stored in freezer between -20°C and -10°C (-4°F and 14°F).

Contraindications

Gel, vaginal insert: Hypersensitivity to prostaglandins or any component of the formulation; fetal distress (suspicion or clinical evidence unless delivery is imminent); unexplained vaginal bleeding during this pregnancy; strong suspicion of marked cephalopelvic disproportion; patients in whom oxytocic drugs are contraindicated or when prolonged contraction of the uterus may be detrimental to fetal safety or uterine integrity (including previous cesarean section or major uterine surgery); >6 previous term pregnancies; patients already receiving oxytocic drugs; hyperactive or hypotonic uterine patterns; when vaginal delivery is not indicated (vasa previa, active herpes genitalia); obstetrical emergencies when surgical intervention would be favorable

Suppository: Hypersensitivity to dinoprostone or any component of the formulation; acute pelvic inflammatory disease; active cardiac, pulmonary, renal or hepatic disease

Warnings/Precautions

Boxed warnings:

- Trained personnel: See “Other warnings/precautions” below.

Dosage form specific issues:

- Gel, vaginal insert: Use caution with ruptured membranes; nonvertex or nonsingleton pregnancy; previous uterine hypertony; glaucoma; history of asthma. Vaginal insert must be removed prior to administration of oxytocin; in case of hyperstimulation or if labor begins; fetal or maternal distress; and prior to amniotomy.

- Suppository: Transient pyrexia and decreased blood pressure may be observed with treatment. Use caution with history of asthma; hypotension or hypertension; cardiovascular, renal, or hepatic disease; anemia; jaundice; diabetes; epilepsy; compromised uteri; cervicitis, endocervical infections or acute vaginitis. Measures should be taken to ensure complete abortion. Commercially available suppositories should not be used for extemporaneous preparation of any other dosage form of drug. Do not use for cervical ripening or other indications in patients with term pregnancy.

Other warnings/precautions:

- Trained personnel: **[U.S. Boxed Warning]: Dinoprostone should be used only by medically-trained personnel in a hospital.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsSkeletal anomalies and embryotoxicity have been observed in animal studies. Although these effects would not be expected in humans when administered after the period of organogenesis, a sustained increase in uterine tone may have increased risks of adverse events to the fetus.

Fetal distress without corresponding maternal uterine hyperstimulation was observed in 3% to 4% of infants exposed to Cervidil® *in utero.* No adverse effects on physical or psychomotor function were observed in a 3 year follow-up study of exposed infants. Abnormal fetal heart rates were observed in 17% of infants exposed to Prepidil® gel *in utero.* Deceleration, intrauterine fetal sepsis, fetal depression and fetal acidosis have also been reported with administration of the gel.

When used for termination of pregnancy, dinoprostone is not considered feticidal, but is used to terminate pregnancy due to its ability to stimulate uterine contractions; do not use if fetus has reached the stage of viability.

LactationExcretion in breast milk unknown

Breast-Feeding ConsiderationsEndogenous PGE_2 can be detected in breast milk. High levels have been associated with diarrhea in nursing infants.

Adverse Reactions

Gel:

1% to 10%:

Central nervous system: Fever (1%)

Gastrointestinal: GI upset (6%)

Genitourinary: Abnormal uterine contractions (7%), warm feeling in vagina (2%)

Neuromuscular & skeletal: Back pain (3%)

Postmarketing and/or case reports: Amnionitis, premature rupture of membranes, uterine rupture (with intracervical administration)

Suppository:

Frequency not defined:

Cardiovascular: Arrhythmia, chest pain, chest tightness, hypotension, syncope

Central nervous system: Chills, dizziness, fever, headache, shivering, tension

Dermatologic: Rash, skin discoloration

Endocrine & metabolic: Breast tenderness, endometritis, hot flashes

Gastrointestinal: Dehydration, diarrhea, nausea, vomiting

Genitourinary: uterine rupture, urinary retention, vaginal pain, vaginismus, vaginitis, vulvitis

Neuromuscular & skeletal: Arthralgia, backache, joint inflammation/pain (new or exacerbated), leg cramps (nocturnal), muscle cramp/pain, myalgia, paresthesia, stiff neck, tremor, weakness

Ocular: Blurred vision, eye pain

Otic: Hearing impairment

Respiratory: Cough, dyspnea, laryngitis, pharyngitis, wheezing

Miscellaneous: Diaphoresis

Postmarketing and/or case reports: MI

Vaginal insert:

1% to 10%: Genitourinary: Uterine hyperstimulation *without* fetal distress (2% to 5%), uterine hyperstimulation *with* fetal distress (3%)

<1%: Abdominal pain, diarrhea, fever, nausea, vomiting

Postmarketing and/or case reports: Uterine rupture

Drug Interactions

Oxytocin: Dinoprostone may enhance the therapeutic effect of Oxytocin. *Risk D: Consider therapy modification*

Monitoring Parameters

Gel, insert: Fetal heart rate and uterine activity

Suppository: Confirmation of fetal death

Nursing: Physical Assessment/MonitoringMonitor temperature, uterine tone, and vaginal discharge closely throughout procedure and postprocedure. Monitor abortion for completeness (other measures may be necessary if incomplete). Assess knowledge/teach patient interventions to reduce side effects and adverse symptoms to report.

Patient EducationNausea and vomiting, cramping or uterine pain, or fever may occur. Report acute pain, respiratory difficulty, or skin rash. Closely monitor for vaginal discharge for several days. Report vaginal bleeding, itching, malodorous or bloody discharge, or severe cramping. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, endocervical (Prepidil®): 0.5 mg/3 g syringe [each package contains a 10 mm and 20 mm shielded catheter]

Insert, vaginal (Cervidil®): 10 mg [releases 0.3 mg/hour]

Suppository, vaginal (Prostin E_2®): 20 mg

Generic AvailableNo

Mechanism of ActionA synthetic prostaglandin E_2 abortifacient that stimulates uterine contractions similar to those seen during natural labor. Prostaglandin E_2 plays a role in cervical ripening, which allows the fetus to pass through the birth canal.

Pharmacodynamics/Kinetics

Onset of action (uterine contractions): Vaginal suppository: Within 10 minutes

Duration: Vaginal insert: 0.3 mg/hour over 12 hours; Vaginal suppository: Up to 2-3 hours

Absorption: Vaginal suppository: Slow

Metabolism: In many tissues including lungs, liver, and kidney

Half-life elimination: 2.5-5 minutes

Time to peak, plasma: Gel: 30-45 minutes

Excretion: Primarily urine; feces (small amounts)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsPGE_2; Prostaglandin E_2

Special Alerts

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, “Infant Deaths Associated with Cough and Cold Medications - Two States, 2005,” *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Pronunciation(dye fen HYE dra meen & fen il EF rin)

U.S. Brand NamesAldex® CT; D-Tann; Dimetapp® Children’s Nighttime Cold & Congestion [OTC]; Robitussin® Night Time Cough & Cold [OTC]

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of symptoms of allergic rhinitis, sinusitis, and other upper respiratory conditions, including sinus/nasal congestion, sneezing, stuffy/runny nose, itchy/watery eyes, and cough

Dosing: Adults**Allergic symptoms, nasal congestion:** Oral:

Aldex® CT: 1-2 tablets every 6 hours

D-Tann: 5-10 mL **or** 1-2 tablets every 12 hours

OTC labeling: 20 mL every 4 hours as needed, maximum 6 doses/24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Allergic symptoms, nasal congestion:** Oral:

Aldex® CT:

Children 6-11 years: One-half to 1 tablet every 6 hours

Children ≥12 years: Refer to adult dosing.

D-Tann:

Children 2-5 years: 1.25-2.5 mL every 12 hours

Children 6-11 years: 2.5-5 mL **or** $^{1}/_{2}$ to 1 tablet every 12 hours

Children ≥12 years: Refer to adult dosing.

OTC labeling:

Children <6 years: Use not recommended

Children 6-11 years (Dimetapp® Children's Nighttime Cold and Congestion): 10 mL every 4 hours as needed, maximum 6 doses/24 hours

Children ≥12 years: Refer to adult dosing.

Dietary ConsiderationsD-Tann chewable tablets contain phenylalanine 5.7 mg per tablet.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to diphenhydramine, phenylephrine, or any component of the formulation; concurrent use with other products containing diphenhydramine (including topical); use with or within 14 days of MAO inhibitors; newborns; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or narrow-angle glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Use with caution in children; may cause excitability. Do not exceed pediatric dosing recommendations. If no recommendations exist on OTC labeling for patient’s age, the product should **not** be administered without the guidance of a physician. Not for OTC use in children <6 years of age.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Self-medication (OTC use): Patients with hypertension, thyroid disease, diabetes mellitus, glaucoma, cardiovascular disease, or prostatic hyperplasia should consult healthcare provider prior to use. Patients with chronic cough (associated with COPD or smoking) and/or productive cough (eg, copious amounts of phlegm) should be evaluated by a healthcare provider prior to use. Ask healthcare provider prior to using with sedatives. If symptoms or cough do not improve, are accompanied by fever, or persist >7 days during use, consult a physician. Do not exceed recommended dose.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Also refer to Diphenhydramine monograph.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsIt is not known if phenylephrine is found in breast milk. Diphenhydramine is excreted in breast milk. Use of this combination is contraindicated by the manufacturers while breast-feeding. Also refer to Diphenhydramine monograph.

Adverse ReactionsFrequency not defined.

Cardiovascular: Chest tightness, extrasystoles, hypotension, palpitation, tachycardia

Central nervous system: Chills, confusion, coordination impaired, dizziness, drowsiness, euphoria, excitation, fatigue, headache, insomnia, irritability, nervousness, neuritis, restlessness, sedation, seizure, vertigo

Dermatologic: Photosensitivity, rash, urticaria

Endocrine & metabolic: Early menses

Gastrointestinal: Anorexia, constipation, diarrhea, dry mucous membranes, epigastric distress, nausea, vomiting, xerostomia

Genitourinary: Dysuria, polyuria, urinary retention

Hematologic: Agranulocytosis, hemolytic anemia, thrombocytopenia

Neuromuscular & skeletal: Paresthesia, tremor

Ocular: Blurred vision, diplopia

Otic: Labyrinthitis, tinnitus

Respiratory: Bronchial secretions (thickening), nasal congestion, throat tightness, wheezing

Miscellaneous: Anaphylaxis, diaphoresis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension:

D-Tann: Diphenhydramine tannate 25 mg and phenylephrine tannate 7.5 mg per 5 mL [118 mL] [contains sodium benzoate, bubblegum flavor]

Syrup:

Dimetapp® Children's Nighttime Cold and Congestion: Diphenhydramine hydrochloride 6.25 mg and phenylephrine hydrochloride 2.5 mg per 5 mL [120 mL] [alcohol free, sugar free; grape flavor]

Robitussin® Night Time Cough and Cold: Diphenhydramine hydrochloride 6.25 mg and phenylephrine hydrochloride 2.5 mg per 5 mL [120 mL] [alcohol free, contains sodium benzoate]

Tablet, chewable:

Aldex® CT: Diphenhydramine hydrochloride 12.5 mg and phenylephrine hydrochloride 5 mg [strawberry flavor]

D-Tann: Diphenhydramine tannate 25 mg and phenylephrine tannate 10 mg [contains phenylalanine 5.7 mg/tablet, berry flavor]

Generic AvailableNo

Mechanism of Action

Diphenhydramine is an H_1-receptor antagonist.

Phenylephrine is a potent, direct-acting alpha-adrenergic stimulator.

Pharmacodynamics/KineticsSee individual agents.

Mental Health: Effects on Mental StatusMay cause sedation, confusion, dizziness, euphoria, excitation, insomnia, irritability, nervousness, and restlessness

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment. May cause sedation; concurrent use with psychotropics may produce additive effects

Index TermsDiphenhydramine Hydrochloride and Phenylephrine Hydrochloride; Diphenhydramine Tannate and Phenylephrine Tannate; Phenylephrine and Diphenhydramine; Phenylephrine Hydrochloride and Diphenhydramine Hydrochloride; Phenylephrine Tannate and Diphenhydramine Tannate

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsRelief of symptoms of upper respiratory mucosal congestion in seasonal and perennial nasal allergies, acute rhinitis, rhinosinusitis, and eustachian tube blockage

Dosing: AdultsAllergic symptoms, nasal congestion:

Based on **pseudoephedrine** component:

Adults: Oral: 60 mg every 4-6 hours, maximum: 240 mg/day

Dosing: ElderlyRefer to adult dosing.

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsDiphenhydramine: **Inhibits** CYP2D6 (moderate)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid:

Benadryl-D™ Children's Allergy and Sinus: Diphenhydramine hydrochloride 12.5 mg and pseudoephedrine hydrochloride 30 mg per 5 mL [alcohol free, sugar free; contains sodium 10 mg/5 mL and sodium benzoate; grape flavor]

Tablet, quick dissolving:

Benadryl® Children's Allergy and Cold Fastmelt™, Benadryl-D™ Allergy and Sinus Fastmelt™: Diphenhydramine citrate 19 mg [equivalent to diphenhydramine hydrochloride 12.5 mg] and pseudoephedrine 30 mg [contains phenylalanine 4.6 mg/tablet; cherry flavor]

Generic AvailableNo

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation). Chronic use of antihistamines will inhibit salivary flow, particularly in elderly patients; this may contribute to periodontal disease and oral discomfort.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDiphenhydramine may cause paradoxical excitation in pediatric patients, and can result in hallucinations, coma, and death in overdose. May cause sedation, sleepiness, dizziness, disturbed coordination, headache, fatigue, nervousness, paradoxical excitement, insomnia, euphoria, or confusion. Pseudoephedrine may cause dizziness, drowsiness, nervousness, and insomnia; may rarely cause hallucinations.

Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis and thrombocytopenia; use caution with clozapine, carbamazepine, and valproic acid; may increase gastric degradation of levodopa and decrease the amount of levodopa absorbed by delaying gastric emptying. Therapeutic effects of cholinergic agents (tacrine, donepezil, rivastigmine, galantamine) and neuroleptics may be antagonized. Central and/or peripheral anticholinergic syndrome can occur when administered with amantadine, rimantadine, narcotic analgesics, phenothiazines, and other antipsychotics (especially with high anticholinergic activity), tricyclic antidepressants and antihistamines. Pseudoephedrine is contraindicated with MAO inhibitors.

Index TermsPseudoephedrine and Diphenhydramine

Special Alerts

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#cough

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, “Infant Deaths Associated with Cough and Cold Medications - Two States, 2005,” *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Medication Safety Issues

Sound-alike/look-alike issues:

DiphenhydrAMINE may be confused with desipramine, dicyclomine, dimenhyDRINATE

Benadryl® may be confused with benazepril, Bentyl®, Benylin®, Caladryl®

Pronunciation(dye fen HYE dra meen)

U.S. Brand NamesAler-Cap [OTC]; Aler-Dryl [OTC]; Aler-Tab [OTC]; AllerMax® [OTC]; Altaryl [OTC]; Banophen® Anti-Itch [OTC]; Banophen® [OTC]; Ben-Tann; Benadryl® Allergy [OTC]; Benadryl® Children's Allergy Fastmelt® [OTC]; Benadryl® Children's Allergy [OTC]; Benadryl® Children's Dye-Free Allergy [OTC]; Benadryl® Itch Stopping Extra Strength [OTC]; Benadryl® Itch Stopping [OTC]; Compoz® Nighttime Sleep Aid [OTC]; Dermamycin® [OTC]; Diphenhist [OTC]; Diphen® AF [OTC]; Diphen® [OTC]; Dytan™; Genahist® [OTC]; Hydramine® [OTC]; Nytol® Quick Caps [OTC]; Nytol® Quick Gels [OTC]; Siladryl® Allergy [OTC]; Silphen® [OTC]; Simply Sleep® [OTC]; Sleep-ettes D [OTC]; Sleepinal® [OTC]; Sominex® Maximum Strength [OTC]; Sominex® [OTC]; Triaminic® Thin Strips™ Cough and Runny Nose [OTC]; Twilite® [OTC]; Unisom® Maximum Strength SleepGels® [OTC]

Canadian Brand NamesAllerdryl®; Allernix; Benadryl®; Nytol®; Nytol® Extra Strength; PMS-Diphenhydramine; Simply Sleep®

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of allergic symptoms caused by histamine release including nasal allergies and allergic dermatosis; adjunct to epinephrine in the treatment of anaphylaxis; nighttime sleep aid; prevention or treatment of motion sickness; antitussive; management of Parkinsonian syndrome including drug-induced extrapyramidal symptoms; topically for relief of pain and itching associated with insect bites, minor cuts and burns, or rashes due to poison ivy, poison oak, and poison sumac

Use: DentalSymptomatic relief of nasal mucosal congestion

Dosing: Adults **Note:** Dosages are expressed as the hydrochloride salt.

Allergic reactions or motion sickness:

Oral: 25-50 mg every 6-8 hours

I.M., I.V.: 10-50 mg per dose; single doses up to 100 mg may be used if needed; not to exceed 400 mg/day

Antitussive: Oral: 25 mg every 4 hours; maximum 150 mg/24 hours

Nighttime sleep aid: Oral: 50 mg at bedtime

Dystonic reaction: I.M., I.V.: 50 mg in a single dose; may repeat in 20-30 minutes if necessary

Relief of pain and itching: Topical: Apply 1% or 2% to affected area up to 3-4 times/day

Dosing: ElderlyInitial: 25 mg 2-3 times/day increasing as needed

Dosing: Pediatric**Note:** Dosages are expressed as the hydrochloride salt.

Allergic reactions or motion sickness: Oral, I.M., I.V.: 5 mg/kg/day or 150 mg/m^2/day in divided doses every 6-8 hours, not to exceed 300 mg/day

Alternate dosing by age: Oral:

2 to <6 years: 6.25 mg every 4-6 hours; maximum: 37.5 mg/day

6 to <12 years: 12.5-25 mg every 4-6 hours; maximum: 150 mg/day

≥12 years: 25-50 mg every 4-6 hours; maximum: 300 mg/day

Night-time sleep aid: Oral: Children ≥12 years: 50 mg at bedtime

Antitussive: Oral:

2 to <6 years: 6.25 mg every 4 hours; maximum 37.5 mg/day

6 to <12 years: 12.5 mg every 4 hours; maximum 75 mg/day

≥12 years: 25 mg every 4 hours; maximum 150 mg/day

Treatment of dystonic reactions: I.M., I.V.: 0.5-1 mg/kg/dose

Relief of pain and itching: Topical: Children ≥2 years: Apply 1% or 2% to affected area up to 3-4 times/day

Calculations

- Body Surface Area: Pediatrics

Administration: I.V.Injection solution: For I.V. or I.M. administration only. Local necrosis may result with SubQ or intradermal use. For I.V. administration, inject at a rate ≤25 mg/minute.

Administration: I.V. DetailpH: 5-6

Administration: OralWhen used to prevent motion sickness, first dose should be given 30 minutes prior to exposure.

Dietary Considerations

Benadryl® Allergy strips contain sodium 4 mg per 25 mg strip.

Benadryl® Children's Allergy chewable tablets contain phenylalanine 4.2 mg, magnesium 15 mg, and sodium 2 mg per 12.5 mg tablet.

Benadryl® Children's Allergy Fastmelt® contains phenylalanine 4.5 mg/tablet and soy protein isolate (contraindicated in patients with soy protein allergies; use caution in peanut allergic individuals, ~10% are estimated to also have soy protein allergies).

Dytan™ chewable tablets contain phenylalanine.

StorageInjection: Store at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light and freezing

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, fat emulsion 10%, LR, $^1/_2NS$, NS.

Y-site administration: Compatible: Acyclovir, aldesleukin, amifostine, amsacrine, aztreonam, ciprofloxacin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, docetaxel, doxorubicin, doxorubicin liposome, etoposide phosphate, famotidine, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, granisetron, heparin, hydrocortisone sodium succinate, idarubicin, linezolid, melphalan, meperidine, meropenem, methotrexate, ondansetron, paclitaxel, piperacillin/tazobactam, potassium chloride, propofol, remifentanil, sargramostim, sufentanil, tacrolimus, teniposide, thiotepa, vinorelbine, vitamin B complex with C. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, cefepime, foscarnet.

Compatibility in syringe: Compatible: Atropine, butorphanol, chlorpromazine, cimetidine, diatrizoate meglumine, diatrizoate meglumine 34.3% and diatrizoate sodium 35%, diatrizoate sodium, diatrizoate sodium 75%, dimenhydrinate, droperidol, fentanyl, fluphenazine, glycopyrrolate, hydromorphone, hydroxyzine, iohexol, iopamidol, iothalamate meglumine, iothalamate meglumine 60%, iothalamate sodium 80%, meperidine, metoclopramide, midazolam, morphine, nalbuphine, pentazocine, perphenazine, prochlorperazine edisylate, promazine, promethazine, ranitidine, scopolamine, sufentanil. **Incompatible:** Diatrizoate meglumine 52% and diatrizoate sodium 8%, diatrizoate sodium 60%, haloperidol, iodipamide meglumine, iodipamide meglumine 52%, ioxaglate meglumine 39.3% and ioxaglate sodium 19.6%, pentobarbital, thiopental. **Variable (consult detailed reference):** Dexamethasone sodium phosphate, diatrizoate meglumine 52% and diatrizoate sodium 8%.

Compatibility when admixed: Compatible: Amikacin, aminophylline, ascorbic acid injection, bleomycin, buprenorphine, colistimethate, erythromycin lactobionate, hydrocortisone sodium succinate, lidocaine, methyldopate, nafcillin, netilmicin, penicillin G potassium , penicillin G sodium, polymyxin B, vitamin B complex with C. **Incompatible:** Amobarbital, amphotericin B, dexamethasone sodium phosphate with lorazepam and metoclopramide, iodipamide meglumine, phenytoin, phenobarbital, thiopental. **Variable (consult detailed reference):** Heparin in solution.

ContraindicationsHypersensitivity to diphenhydramine or any component of the formulation; acute asthma; neonates or premature infants; breast-feeding; use as a local anesthetic (injection)

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or angle-closure glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.
- Soy protein: Some preparations contain soy protein; avoid use in patients with soy protein or peanut allergies.

Other warnings/precautions:

- Self-medication (OTC use): Do not use with other products containing diphenhydramine, even ones used on the skin. Oral products are not for OTC use in children <6 years of age. Topical products should not be used on large areas of the body, or on chicken pox or measles. Healthcare provider should be contacted if topical use is needed for >7 days. Topical products are not for OTC use in children <2 years of age.

Geriatric ConsiderationsDiphenhydramine has high sedative and anticholinergic properties, so it may not be considered the antihistamine of choice for prolonged use in the elderly. Its use as a sleep aid is discouraged due to its anticholinergic effects; interpretive guidelines from the Centers for Medicare and Medicaid Services (CMS) discourage the use of diphenhydramine as a sedative or anxiolytic in long-term care facilities.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Diphenhydramine crosses the human placenta. One retrospective study showed an increased risk of cleft palate formation following maternal use of diphenhydramine during the 1st trimester of pregnancy; however, later studies have not confirmed this finding. Signs of toxicity and symptoms of withdrawal have been reported in infants following high doses or chronic maternal use close to term. Diphenhydramine has been evaluated for the treatment of hyperemesis gravidarum. It is generally not considered the antihistamine of choice for treating allergic rhinitis or nausea and vomiting during pregnancy.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsInfants may be more sensitive to the effects of antihistamines. Use while breast-feeding is contraindicated by the manufacturer.

Adverse ReactionsFrequency not defined.

Cardiovascular: Chest tightness, extrasystoles, hypotension, palpitation, tachycardia

Central nervous system: Chills, confusion, convulsion, disturbed coordination, dizziness, euphoria, excitation, fatigue, headache, insomnia, irritability, nervousness, paradoxical excitement, restlessness, sedation, sleepiness, vertigo

Dermatologic: Photosensitivity, rash, urticaria

Endocrine & metabolic: Menstrual irregularities (early menses)

Gastrointestinal: Anorexia, constipation, diarrhea, dry mucous membranes, epigastric distress, nausea, throat tightness, vomiting, xerostomia

Genitourinary: Difficult urination, urinary frequency, urinary retention

Hematologic: Agranulocytosis, hemolytic anemia, thrombocytopenia

Neuromuscular & skeletal: Neuritis, paresthesia, tremor

Ocular: Blurred vision, diplopia

Otic: Labyrinthitis (acute), tinnitus

Respiratory: Nasal stuffiness, thickening of bronchial secretions, wheezing

Miscellaneous: Anaphylactic shock, diaphoresis

Metabolism/Transport Effects**Inhibits** CYP2D6 (moderate)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsMay suppress the wheal and flare reactions to skin test antigens
Monitoring ParametersRelief of symptoms, mental alertness
Reference Range

Antihistamine effects at levels >25 ng/mL

Drowsiness at levels 30-40 ng/mL

Mental impairment at levels >60 ng/mL

Therapeutic: Not established

Toxic: >0.1 mcg/mL

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationTake as directed; do not exceed recommended dose. Avoid use of other depressants, alcohol, or sleep-inducing medications unless approved by prescriber. You may experience drowsiness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth, nausea, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report persistent sedation, confusion, or agitation; changes in urinary pattern; blurred vision; sore throat, respiratory difficulty, or expectorating (thick secretions); or lack of improvement or worsening or condition. **Breast-feeding precaution:** Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet, as hydrochloride: 25 mg, 50 mg

Aler-Dryl, AllerMax®, Compoz® Nighttime Sleep Aid, Sleep-ettes D, Sominex® Maximum Strength, Twilite®: 50 mg

Nytol® Quick Caps, Simply Sleep®: 25 mg

Capsule, as hydrochloride: 25 mg, 50 mg

Aler-Cap, Banophen®, Benadryl® Allergy, Diphen®, Diphenhist, Genahist®: 25 mg

Sleepinal®: 50 mg

Capsule, softgel, as hydrochloride: 50 mg

Benadryl® Dye-Free Allergy: 25 mg [dye-free]

Compoz® Nighttime Sleep Aid, Nytol® Quick Gels, Sleepinal®, Unisom® Maximum Strength SleepGels®: 50 mg

Captab, as hydrochloride:

Diphenhist®: 25 mg

Cream, as hydrochloride: 2% (30 g)

Banophen® Anti-Itch: 2% (30 g) [contains zinc acetate 0.1%]

Benadryl® Itch Stopping: 1% (30 g) [contains zinc acetate 0.1%]

Benadryl® Itch Stopping Extra Strength: 2% (30 g) [contains zinc acetate 0.1%]

Diphenhist®: 2% (30 g) [contains zinc acetate 0.1%]

Elixir, as hydrochloride:

Altaryl: 12.5 mg/5 mL (120 mL, 480 mL, 3840 mL) [cherry flavor]

Banophen®: 12.5 mg/5 mL (120 mL)

Diphen AF: 12.5 mg/5 mL (240 mL, 480 mL) [alcohol free; cherry flavor]

Gel, topical, as hydrochloride:

Benadryl® Itch Stopping Extra Strength: 2% (120 mL)

Injection, solution, as hydrochloride: 50 mg/mL (1 mL, 10 mL)

Liquid, as hydrochloride:

AllerMax®: 12.5 mg/5 mL (120 mL)

Benadryl® Allergy: 12.5 mg/5 mL (120 mL, 240 mL) [alcohol free; contains sodium benzoate; cherry flavor]

Benadryl® Children's Dye-Free Allergy: 12.5 mg/5 mL (120 mL) [alcohol free, dye free, sugar free; contains sodium benzoate; bubble gum flavor]

Genahist®: 12.5 mg/5 mL (120 mL) [alcohol free, sugar free; contains sodium benzoate; cherry flavor]

Hydramine®: 12.5 mg/5 mL (120 mL, 480 mL) [alcohol free]

Siladryl® Allergy: 12.5 mg/5 mL (120 mL, 240 mL, 480 mL) [alcohol free, sugar free; black cherry flavor]

Liquid, topical, as hydrochloride [stick]:

Benadryl® Itch Stopping Extra Strength: 2% (14 mL) [contains zinc acetate 0.1% and alcohol]

Solution, oral, as hydrochloride:

Diphenhist: 12.5 mg/5 mL (120 mL, 480 mL) [alcohol free; contains sodium benzoate]

Solution, topical, as hydrochloride [spray]:

Benadryl® Itch Stopping Extra Strength: 2% (60 mL) [contains zinc acetate 0.1% and alcohol]

Dermamycin®: 2% (60 mL) [contains menthol 1%]

Strips, oral, as hydrochloride:

Benadryl® Allergy: 25 mg (10s) [contains sodium 4 mg/strip; vanilla mint flavor]

Benadryl® Children’s Allergy: 12.5 mg (10s) [vanilla mint flavor]

Triaminic® Thin Strips™ Cough and Runny Nose: 12. 5 mg (16s) [grape flavor]

Suspension, as tannate:

Ben-Tann: 25 mg/5 mL (120 ml) [contains sodium benzoate; strawberry flavor]

Dytan™: 25 mg/5 mL (120 mL) [strawberry flavor] [DSC]

Syrup, as hydrochloride:

Silphen® Cough: 12.5 mg/5 mL (120 mL, 240 mL, 480 mL) [contains alcohol; 5%; strawberry flavor]

Tablet, as hydrochloride: 25 mg, 50 mg

Aler-Tab, Benadryl® Allergy, Genahist®, Sominex®: 25 mg

Tablet, chewable, as hydrochloride:

Benadryl® Children's Allergy: 12.5 mg [contains phenylalanine 4.2 mg, magnesium 15 mg, and sodium 2 mg per tablet; grape flavor]

Tablet, chewable, as tannate:

Dytan™: 25 mg [contains phenylalanine; strawberry flavor]

Tablet, orally disintegrating, as citrate:

Benadryl® Children's Allergy Fastmelt®: 19 mg [equivalent to diphenhydramine hydrochloride 12.5 mg; contains phenylalanine 4.5 mg/tablet and soy protein isolate; cherry flavor]

Generic AvailableYes: Excludes chewable tablet, gel, orally-disintegrating tablet, stick, strip

Pricing: U.S. (www.drugstore.com)

Capsules (DiphenhydrAMINE HCl)

25 mg (100): $11.99

50 mg (100): $13.99

Chewable (Dytan)

25 mg (60): $76.55

Liquid (Q-Dryl)

12.5 mg/5 mL (473): $13.01

Solution (DiphenhydrAMINE HCl)

50 mg/mL (25): $35.99

Mechanism of ActionCompetes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract; anticholinergic and sedative effects are also seen

Pharmacodynamics/Kinetics

Onset of action: Maximum sedative effect: 1-3 hours

Duration: 4-7 hours

Distribution: V_d: 3-22 L/kg

Protein binding: 78%

Metabolism: Extensively hepatic n-demethylation via CYP2D6; minor demethylation via CYP1A2, 2C9 and 2C19; smaller degrees in pulmonary and renal systems; significant first-pass effect

Bioavailability: Oral: ~40% to 70%

Half-life elimination: 2-10 hours; Elderly: 13.5 hours

Time to peak, serum: 2-4 hours

Excretion: Urine (as unchanged drug)

Pharmacotherapy PearlsDiphenhydramine citrate 19 mg is equivalent to diphenhydramine hydrochloride 12.5 mg

Dental Health Professional Considerations25-50 mg of diphenhydramine orally every 4-6 hours can be used to treat mild dermatologic manifestations of allergic reactions to penicillin and other antibiotics. Diphenhydramine is not recommended as local anesthetic for either infiltration route or nerve block since the vehicle has caused local necrosis upon injection. A 50:50 mixture of diphenhydramine liquid (12.5

mg/5 mL) in Kaopectate® or Maalox® is used as a local application for recurrent aphthous ulcers; swish 1 tablespoonful for 2 minutes 4 times/day.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and dry mucous membranes. Chronic use of antihistamines will inhibit salivary flow, particularly in elderly patients; may contribute to periodontal disease and oral discomfort. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentAlong with benztropine, considered the drug of choice for patients with acute dystonic reactions. The usual adult dosage is I.M. 50 mg. In an emergency situation (laryngeal spasm), it should be given intravenously. It is the most sedating antihistamine used to treat drug-induced EPS. Generally not a first-line agent for insomnia, but often utilized in individuals where benzodiazepines are contraindicated (eg, patients with a history of substance abuse).

Anesthesia and Critical Care Concerns/Other ConsiderationsDiphenhydramine's use as a sleep aid is discouraged due to its anticholinergic effects.

Index TermsDiphenhydramine Citrate; Diphenhydramine Hydrochloride; Diphenhydramine Tannate

Medication Safety Issues

Sound-alike/look-alike issues:

Lomotil® may be confused with Lamictal®, Lamisil®, lamotrigine, Lanoxin®, Lasix®, ludiomil

Lonox® may be confused with Lanoxin®, Loprox®

International issues:

Lomotil® may be confused with Lemesil® which is a brand name for nimesulide in Greece

Lonox® may be confused with Flomox® which is a brand of cefcapene in Japan

Pronunciation(dye fen OKS i late & A troe peen)
U.S. Brand NamesLomotil®; Lonox®
Canadian Brand NamesLomotil®
Pharmacologic CategoryAntidiarrheal
Use: Labeled IndicationsTreatment of diarrhea
Dosing: AdultsDiarrhea: Oral: Diphenoxylate 5 mg 4 times/day until control achieved (maximum: 20 mg/day), then reduce dose as needed; some patients may be controlled on doses of 5 mg/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricDiarrhea: Oral: Children 2-12 years (use with caution in young children due to variable responses): Liquid: Diphenoxylate 0.3-0.4 mg/kg/day in 4 divided doses until control achieved (maximum: 10 mg/day), then reduce dose as needed; some patients may be controlled on doses as low as 25% of the initial daily dose
Administration: OralIf there is no response within 48 hours of continuous therapy, this medication is unlikely to be effective and should be discontinued; if chronic diarrhea is not improved symptomatically within 10 days at maximum dosage, control is unlikely with further use. Use of the liquid preparation is recommended in children <13 years of age; use plastic dropper provided when measuring liquid.
RestrictionsC-V
ContraindicationsHypersensitivity to diphenoxylate, atropine, or any component of the formulation; obstructive jaundice; diarrhea associated with pseudomembranous enterocolitis or enterotoxin-producing bacteria; not for use in children <2 years of age
Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Dehydration/electrolyte imbalance: In case of severe dehydration or electrolyte imbalance, withhold diphenoxylate/atropine treatment until corrective therapy has been initiated. Use in conjunction with fluid and electrolyte therapy when appropriate. Inhibiting peristalsis may lead to fluid retention in the intestine aggravating dehydration and electrolyte imbalance.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Ulcerative colitis: Use with caution in patients with acute ulcerative colitis.

Special populations:

- Pediatrics: Use with caution in children. Younger children may be predisposed to toxicity; signs of atropinism may occur even at recommended doses, especially in patients with Down syndrome. Overdose in children may result in severe respiratory depression, coma, and possibly permanent brain damage.

Other warnings/precautions:

- Appropriate use: If there is no response within 48 hours, this medication is unlikely to be effective and should be discontinued; if chronic diarrhea is not improved symptomatically within 10 days at maximum dosage, control is unlikely with further use. Reduction of intestinal motility may be deleterious in diarrhea resulting from *Shigella, Salmonella*, toxigenic strains of *E. coli*, and pseudomembranous enterocolitis associated with broad-spectrum antibiotics; use is not recommended.
- Dependence: Physical and psychological dependence have been reported with higher than recommended dosing.

Geriatric ConsiderationsElderly are particularly sensitive to fluid and electrolyte loss. This generally results in lethargy, weakness, and confusion. Repletion and maintenance of electrolytes and water are essential in the treatment of diarrhea. Drug therapy must be limited in order to avoid toxicity with this agent.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not noted in animal studies; decreased maternal weight, fertility and litter sizes were observed. There are no adequate and well-controlled studies in pregnant women.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsAtropine is excreted in breast milk (refer to Atropine monograph); the manufacturer states that diphenoxylic acid may be excreted in breast milk.

Adverse ReactionsFrequency not defined.

Cardiovascular: Tachycardia

Central nervous system: Confusion, depression, dizziness, drowsiness, euphoria, flushing, headache, hyperthermia, lethargy, malaise, restlessness, sedation

Dermatologic: Angioneurotic edema, dry skin, pruritus, urticaria

Gastrointestinal: Abdominal discomfort, anorexia, gum swelling, nausea, pancreatitis, paralytic ileus, toxic megacolon, vomiting, xerostomia

Genitourinary: Urinary retention

Neuromuscular & skeletal: Numbness

Miscellaneous: Anaphylaxis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersWatch for signs of atropinism (dryness of skin and mucous membranes, tachycardia, thirst, flushing); monitor number and consistency of stools; observe for signs of toxicity, fluid and electrolyte loss, hypotension, and respiratory depression

Nursing: Physical Assessment/MonitoringSee individual agent for Atropine.

Patient EducationSee individual agent for Atropine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral: Diphenoxylate hydrochloride 2.5 mg and atropine sulfate 0.025 mg per 5 mL (5 mL, 10 mL, 60 mL)

Lomotil®: Diphenoxylate hydrochloride 2.5 mg and atropine sulfate 0.025 mg per 5 mL (60 mL) [contains alcohol 15%; cherry flavor]

Tablet: Diphenoxylate hydrochloride 2.5 mg and atropine sulfate 0.025 mg

Lomotil®, Lonox®: Diphenoxylate hydrochloride 2.5 mg and atropine sulfate 0.025 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Liquid (Diphenoxylate-Atropine)

2.5-0.025 mg/5 mL (60): $19.99

Liquid (Lomotil)

2.5-0.025 mg/5 mL (60): $29.39

Tablets (Diphenoxylate-Atropine)

2.5-0.025 mg (30): $13.99

Tablets (Lomotil)

2.5-0.025 mg (30): $35.99

Tablets (Lonox)

2.5-0.025 mg (60): $27.99

Mechanism of ActionDiphenoxylate inhibits excessive GI motility and GI propulsion; commercial preparations contain a subtherapeutic amount of atropine to discourage abuse

Pharmacodynamics/Kinetics

Atropine: See Atropine monograph.

Diphenoxylate:

Onset of action: Antidiarrheal: 45-60 minutes

Duration: Antidiarrheal: 3-4 hours

Absorption: Well absorbed

Metabolism: Extensively hepatic via ester hydrolysis to diphenoxylic acid (active)

Half-life elimination: Diphenoxylate: 2.5 hours; Diphenoxylic acid: 12-14 hours

Time to peak, serum: 2 hours

Excretion: Primarily feces (49% as unchanged drug and metabolites); urine (~14%, <1% as unchanged drug)

Related Information

- Atropine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness, restlessness, drowsiness, or insomnia; rarely may produce euphoria

Mental Health: Effects on Psychiatric TreatmentConcurrent use with MAO inhibitors may result in hypertensive crisis; additive sedation and dry mouth with psychotropics; use with benztropine or other anticholinergic agents may result in ileus

Index TermsAtropine and Diphenoxylate

Diphtheria and Tetanus Toxoids, and Acellular Pertussis Vaccine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Carefully review product labeling to prevent inadvertent administration of Tdap when DTaP is indicated. Tdap contains lower amounts of diphtheria toxoid and some pertussis antigens than DTaP.

Tdap is not indicated for use in children <10 years of age

DTaP is not indicated for use in persons ≥7 years of age

Guidelines are available in case of inadvertent administration of these products; refer to ACIP recommendations, February 2006 available at http://www.cdc.gov/mmwr/preview/mmwrhtml/rr55e223a1.htm

Note:

DTaP: Diphtheria and tetanus toxoids and acellular pertussis vaccine

DTP: Diphtheria and tetanus toxoids and pertussis vaccine (unspecified pertussis antigens)

DTwP: Diphtheria and tetanus toxoids and whole-cell pertussis vaccine (no longer available on U.S. market)

Tdap: Tetanus toxoid, reduced diphtheria toxoid, and acellular pertussis vaccine

Pronunciation(dif THEER ee a & TET a nus TOKS oyds & ay CEL yoo lar per TUS sis vak SEEN)
U.S. Brand NamesAdacel®; Boostrix®; Daptacel®; Infanrix®; Tripedia®
Canadian Brand NamesAdacel®
Pharmacologic CategoryVaccine, Inactivated (Bacterial)
Use: Labeled Indications
Daptacel®, Infanrix®, Tripedia® (DTaP): Active immunization against diphtheria, tetanus, and pertussis from age 6 weeks through 6 years of age (prior to seventh birthday)

Adacel®, Boostrix® (Tdap): Active booster immunization against diphtheria, tetanus, and pertussis

The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination for the following:

Children 6 weeks to <7 years (DTaP): For primary immunization against diphtheria, tetanus and pertussis

Adolescents 11-18 years (Tdap) (Adacel®, Boostrix®):

- A single dose of Tdap as a booster dose in adolescents who have completed the recommended childhood DTaP vaccination series (preferred age of administration is 11-12 years)
- A single dose of Tdap should be given to replace a single dose of Td if the last dose of Td was ≥5 years earlier; lesser intervals may be used if the benefit outweighs the risk (not for multiple administrations; recommendations are for the replacement of a single dose of Td only)
- Persons wounded in bombings or similar mass casualty events and who cannot confirm receipt of a tetanus booster within the previous 5 years and who have penetrating injuries or nonintact skin exposure should receive a single dose of Tdap

Adults aged 19-64 (Adacel®): A single dose of Tdap should be given to replace a single dose of Td if the last dose of Td was ≥10 years earlier (not for multiple administrations; recommendations are for the replacement of a single dose of Td only). A shorter interval (<10 years but at least 2 years since last dose of Td) may be considered in the following situations:

- To protect against pertussis
- To protect against pertussis transmission to infants in adults who anticipate close contact with children <12 months of age; Tdap should be administered at least 2 weeks prior to beginning close contact
- Healthcare providers with direct patient contact
- Persons wounded in bombings or similar mass casualty events and who cannot confirm receipt of a tetanus booster within the previous 5 years and who have penetrating injuries or non-intact skin exposur, should receive a single dose of Tdap

Dosing: Adults

Booster immunization:

ACIP recommendations: I.M.: Adults 19-64 years (Adacel®): 0.5 mL. A single dose should be given instead of Td in adults if they received their last dose of Td ≥10 years previous. Shorter intervals (as short as 2 years) may used among healthcare providers, adults in contact with infants, or others in settings with increased risk for pertussis, including during pertussis outbreaks. Adacel® should only be used to replace a single booster dose of Td.

Manufacturer's labeling: I.M.: Adults ≤64 years (Adacel®): 0.5 mL as a single dose, administered 5 years after last dose of DTwP or DTaP vaccine.

Wound management: Adacel® (in patients 11-64 years of age) or Boostrix® (in patients 10-18 years of age) may be used as an alternative to Td vaccine when a tetanus toxoid-containing vaccine is needed for wound management, and in whom the pertussis component is also indicated.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Primary immunization: Children 6 weeks to <7 years: I.M.: **Note:** Whenever possible, the same product should be used for all doses. Interruption of recommended schedule does not require starting the series over; a delay between doses should not interfere with final immunity.

Daptacel®, Infanrix®, Tripedia®: 0.5 mL per dose, total of 5 doses administered as follows:

Three doses, usually given at 2-, 4-, and 6 months of age; may be given as early as 6 weeks of age and repeated every 6-8 weeks

Fourth dose: Given at ~15-20 months of age, but at least 6 months after third dose

Fifth dose: Given at 4-6 years of age, prior to starting school or kindergarten; if the fourth dose is given at ≥4 years of age, the fifth dose may be omitted

Booster immunization:

ACIP recommendations: Adolescents 11-18 years: I.M.: 0.5 mL. A single dose of Tdap should be given instead of Td in adolescents who have completed the recommended childhood DTP/DTaP series and have not received Td or Tdap; preferred age of vaccination with Tdap is 11-12 years. Adolescents who received Td but not Tdap and who have completed the recommended childhood DTP/DTaP series are encouraged to receive Tdap; an interval of at least 5 years between Td and Tdap is recommended, but lesser intervals may be used if the benefit outweighs the risk.

Manufacturer's labeling:

Children 10-18 years (Boostrix®): I.M.: 0.5 mL as a single dose, administered 5 years after last dose of DTwP or DTaP vaccine.

Children ≥11 years (Adacel®): I.M.: Refer to adult dosing.

Wound management: Refer to adult dosing.

Administration: I.M.Shake suspension well.
Adacel®, Boostrix®: Administer only I.M. in deltoid muscle of upper arm.

Daptacel®, Infanrix®, Tripedia®: Administer only I.M. in anterolateral aspect of thigh or deltoid muscle of upper arm.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

Diphtheria and Tetanus Toxoids, and Acellular Pertussis vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Diphtheria and Tetanus Toxoids, and Acellular Pertussis vaccine with live vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: Diphtheria and Tetanus Toxoids, and Acellular Pertussis vaccine may be given simultaneously at different sites or at any interval between doses. Examples of antibody containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageRefrigerate at 2°C to 8°C (35°F to 46°F). Do not freeze.
ContraindicationsHypersensitivity to diphtheria, tetanus toxoids, pertussis, or any component of the formulation; history of any of the following effects from previous administration of pertussis-containing vaccine - progressive neurologic disorder, including infantile spasms, uncontrolled epilepsy or progressive epilepsy (postpone until condition stabilized); encephalopathy occurring within 7 days of administration and not attributable to another cause
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

- Arthus-type hypersensitivity: Td or Tdap vaccines and emergency doses of Td vaccine should not be given more frequently than every 10 years in patients who have experienced a serious Arthus-type hypersensitivity reaction following a prior use of tetanus toxoid even if the wound is not clean or minor; these patients generally have high serum antitoxin levels.

- Reactions from previous dose: Carefully consider use in patients with history of any of the following effects from previous administration of whole-cell DTP or acellular pertussis vaccine: Fever ≥105°F (40.5°C) within 48 hours of unknown cause; seizures with or without fever occurring within 3 days; persistent, inconsolable crying episodes lasting ≥3 hours and occurring within 48 hours; shock or collapse within 48 hours.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).
- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.
- Guillain-Barré syndrome: Continue use with caution if Guillain-Barré syndrome occurs within 6 weeks of prior tetanus toxoid.
- Neurologic disorders: Use with caution in patients with history of seizure disorder, progressive neurologic disease, or conditions predisposing to seizures; ACIP and APP guidelines recommend deferring immunization until health status can be assessed and condition stabilized.
- Poliomyelitis: Defer administration during outbreaks of poliomyelitis.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Adults: Safety and efficacy of Boostrix® have not been established in patients >18 years of age.
- Elderly: Safety and efficacy of Adacel® have not been established adults ≥65 years of age.
- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination. May be used in patients with HIV infection.
- Pediatrics: Safety and efficacy of Adacel® have not been established in children <11 years. Safety and efficacy of Boostrix® have not been established in patients <7 years of age. Safety and efficacy of Daptacel®, Infanrix®, Tripedia® have not been established in children <6 weeks of age or ≥7 years of age.

Dosage form specific issues:

- Adacel®: Formulated with the same antigens found in Daptacel®, but with reduced quantities of tetanus and pertussis. Use in the primary immunization series or to complete the primary series has not been evaluated.
- Boostrix®: Formulated with the same antigens found in Infanrix®, but in reduced quantities. Use in the primary immunization series or to complete the primary series has not been evaluated.
- Latex: Packaging may contain natural latex rubber.
- Thimerosal: Products may contain thimerosal.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. It is not known whether the vaccine can cause fetal harm when administered to a pregnant woman or can affect reproductive capacity. Daptacel®, Infanrix®, and Tripedia® are not recommended for use in a pregnant woman or any patient ≥7 years of age. Although pregnancy itself is generally not considered a contraindication to Tdap (Adacel®, Boostrix®) vaccination, Td is preferred to Tdap when vaccination cannot be delayed during pregnancy. In order to help prevent pertussis exposure among infants, the use of Tdap, is recommended in women of childbearing potential prior to pregnancy. Due to lack of information with Tdap, a pregnancy registry has been established for women who may become exposed to Boostrix® (888-825-5249) or Adacel® (800-822-2463) while pregnant.

Breast-Feeding ConsiderationsBreast-feeding is not a contraindication to vaccine administration. Women who have not previously had a dose of Tdap should receive a dose postpartum to help prevent pertussis in infants <12 months of age.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Daptacel®, Infanrix®, Tripedia® (incidence of erythema, swelling, and fever increases with successive doses):

Frequency not defined:

Central nervous system: Drowsiness, fever, fussiness, irritabililty, lethargy

Gastrointestinal: Appetite decreased, vomiting

Local: Pain, redness, swelling, tenderness

Miscellaneous: Prolonged or persistent crying, refusal to play

Postmarketing and/or case reports: Allergic reaction, anaphylactic reactions, cellulitis, cyanosis, diarrhea, ear pain, encephalopathy, erythema, hypersensitivity, hypotonia, hypotonic-hyporesponsive episode, idiopathic thrombocytopenic purpura, infantile spasm, injection site reaction (abscess, cellulitis, mass, nodule, rash), intussusception, irritability, limb swelling, lymphadenopathy, nausea, pruritus, rash, respiratory tract infection, seizure, screaming, somnolence, sudden infant death syndrome, thrombocytopenia, urticaria

Adacel®, Boostrix®: Note: Ranges presented, actual percent varies by product and age group

>10%:

Central nervous system: Fatigue, tiredness (24% to 37%; grade 3/severe: 1% to 4%), headache (34% to 44%; grade 3/severe: 2% to 4%), chills (8% to 15%; severe: <1%)

Gastrointestinal: Gastrointestinal symptoms, includes abdominal pain, diarrhea, nausea and/or vomiting (3% to 26%; grade 3/severe: ≤3%)

Local: Injection site pain (66% to 78%; grade 3/severe: 1% to 5%), arm circumference increased (28%; >40 mm: 0.5%), redness (21% to 25%; ≥50 mm: 2% to 4%), swelling (21%; ≥50 mm: 3%)

Neuromuscular & skeletal: Body aches/muscle weakness (22% to 30%; severe: 1%), soreness/swollen joints (9% to 11%; severe: <1%)

1% to 10%:

Central nervous system: Fever ≥38°C (≥100.4˚F: 1% to 5%)

Dermatologic: Rash (2% to 3%)

Miscellaneous: Lymph node swelling (7%; severe: <1%)

Postmarketing and/or case reports: Arthralgia, back pain, bruising, diabetes mellitus, encephalitis, exanthema, facial palsy, Henoch-Schönlein purpura, injection site reaction (induration, inflammation, mass, nodule, warmth), limb swelling (extensive), lymphadenitis, lymphadenopathy, myalgia, myocarditis, nerve compression, paresthesia, pruritus, seizure, sterile abscess, urticaria

Additional adverse reactions associated with diphtheria, tetanus, and/or pertussis antigens: Arthus hypersensitivity, brachial neuritis, GBS, peripheral/central mononeuropathies

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [Tdap, booster formulation]:

Adacel®: Diphtheria 2 Lf units, tetanus 5 Lf units, and acellular pertussis antigens (detoxified pertussis toxin 2.5 mcg, filamentous hemagglutinin 5 mcg, pertactin 3 mcg, fimbriae [types 2 and 3] 5 mcg) per 0.5 mL (0.5 mL) [contains aluminum]

Boostrix®: Diphtheria 2.5 Lf units, tetanus 5 Lf units, and acellular pertussis antigens (inactivated pertussis toxin 8 mcg, filamentous hemagglutinin 8 mcg, pertactin 2.5 mcg) per 0.5 mL (0.5 mL) [preservative free; contains aluminum and polysorbate 80; prefilled syringes contain natural rubber/natural latex]

Injection, suspension [DTaP, active immunization formulation]:

Daptacel®: Diphtheria 15 Lf units, tetanus 5 Lf units, and acellular pertussis antigens (detoxified pertussis toxin 10 mcg, filamentous hemagglutinin 5 mcg, pertactin 3 mcg, fimbriae [types 2 and 3] 5 mcg) per 0.5 mL (0.5 mL) [contains aluminum; contains natural rubber/natural latex in packaging]

Infanrix®: Diphtheria 25 Lf units, tetanus 10 Lf units, and acellular pertussis antigens (inactivated pertussis toxin 25 mcg, filamentous hemagglutinin 25 mcg, pertactin 8 mcg) per 0.5 mL (0.5 mL) [contains aluminum and polysorbate 80; prefilled syringes contain natural rubber/natural latex]

Tripedia®: Diphtheria 6.7 Lf units, tetanus 5 Lf units, and acellular pertussis antigens (inactivated pertussis toxin 23.4 mcg, filamentous hemagglutinin 23.4 mcg) per 0.5 mL (0.5 mL) [contains aluminum, natural rubber/natural latex in packaging, polysorbate 80, and thimerosal (trace amounts)]

Note: Tripedia® vaccine is also used to reconstitute ActHIB® to prepare TriHIBit® vaccine (diphtheria, tetanus toxoids, and acellular pertussis and *Haemophilus influenzae* b conjugate vaccine combination)

Generic AvailableNo

Mechanism of ActionPromotes active immunity to diphtheria, tetanus, and pertussis by inducing production of specific antibodies.

Related Information

- Immunization Recommendations
- Prophylaxis for Patients Exposed to Common Communicable Diseases

Pharmacotherapy PearlsDTaP may be given for the fourth and fifth doses in children who started immunization with DTP vaccine. In patients who cannot be given pertussis vaccine, DT for pediatric use should be given to complete the series.

TriHIBit® is Tripedia® vaccine used to reconstitute ActHIB® (*Haemophilus* b conjugate) vaccine. The combination can be used for the DTaP dose given at 15-18 months when Tripedia® was used for the initial doses and a primary series of HIB vaccine has been given.

Adacel® is formulated with the same antigens found in Daptacel® but with reduced quantities of pertussis and tetanus. It is intended for use as a booster dose in children and adults, 11-64 years of age, and **not** for primary immunization.

Boostrix® is formulated with the same antigens found in Infanrix® but in reduced quantities. It is intended for use as a booster dose in children 10-18 years, and is **not** for primary immunization.

The ACIP considers Adacel® and Boostrix® to be interchangeable when administered to adolescents for childhood vaccination according to the Child and Adolescent Immunization Schedule.

Acetaminophen or ibuprofen may reduce or prevent fever; the child's medical record should document that the small risk of postvaccination seizure and the benefits of the pertussis vaccination were discussed with the patient; parents or guardians should be questioned prior to administration of vaccine as to any adverse reactions from previous dose. Provide Vaccine Information Materials, as required by National Childhood Vaccine Injury Act of 1986, prior to immunization.

Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title and address be entered into the patient's permanent medical record.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentNone reported

U.S. Brand NamesTriHIBit®
Pharmacologic CategoryVaccine, Inactivated (Bacterial)
Use: Labeled IndicationsActive immunization of children 15-18 months of age for prevention of diphtheria, tetanus, pertussis, and invasive disease caused by *H. influenzae* type b

The Advisory Committee on Immunization Practices (ACIP) recommends the use of TriHIBit® for the fourth dose of the diphtheria, tetanus, pertussis, and *Haemophilus* vaccine series. Whenever feasible, the same manufacturer should be used to provide the pertussis component; however, vaccination should not be deferred if a specific brand is not known or is not available.

Dosing: PediatricImmunization: Children 15-18 months: I.M.: 0.5 mL: **Note:** For use as the fourth dose of the DTaP and Hib series (see individual vaccines). May be used as a booster in children 12-20 months of age as long as 6 months have elapsed since the third dose.
Administration: I.M.For I.M use only; do not administer I.V. or SubQ. Administer in the anterolateral aspects of the thigh or the deltoid muscle of the upper arm. Do not inject in the gluteal area or where there may be a major nerve trunk. Do not administer additional vaccines or immunoglobulins at the same site or using the same syringe.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends "it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection."

Administration with other vaccines:

DTaP/Hib with live vaccines: May be given simultaneously or at any interval between doses.

DTaP/Hib with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: DTaP/Hib may be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageRefrigerate ActHIB® and Tripedia® at 2°C to 8°C (35°F to 46°F). Do not freeze. Suspension should be used within 30 minutes of reconstitution.
ReconstitutionAgitate vial of Tripedia®, then withdraw 0.6 mL to reconstitute ActHIB® powder; agitate thoroughly to form a suspension. **Tripedia® should not be used to reconstitute any vaccines other than ActHIB®.**
ContraindicationsHypersensitivity to diphtheria, tetanus toxoids, pertussis, *Haemophilus*, or any component of the formulation; history of any of the following effects from previous administration of pertussis-containing vaccine: Progressive neurologic disorder, including infantile spasms, uncontrolled epilepsy, or progressive epilepsy (postpone until condition stabilized); encephalopathy occurring within 7 days of administration and not attributable to another cause
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

- Reactions from previous pertussis vaccine: Carefully consider use in patients with history of any of the following effects from previous administration of whole-cell DTP or acellular pertussis vaccine: Fever ≥105°F (40.5°C) within 48 hours of unknown cause; seizures with or without fever occurring within 3 days; persistent, inconsolable crying episodes lasting ≥3 hours and occurring within 48 hours; shock or collapse (hypotonic-hyporesponsive episode [HHE]) occurring within 48 hours.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

- Guillain-Barré syndrome: Use with caution if Guillain-Barré syndrome occurred within 6 weeks of prior tetanus toxoid.

- Neurologic disorders: Use with caution in patients with history of seizure disorder, progressive neurologic disease, or conditions predisposing to seizures; ACIP and AAP guidelines recommend deferring immunization until health status can be assessed and condition stabilized. Antipyretics should be administered at the time of and for 24 hours following vaccination to patients at high risk for seizures.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Adults: This combination is not for use in adults.
- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy [including high-dose corticosteroids]); may have a reduced response to vaccination. May be used in patients with HIV infection.
- Pediatrics: This combination is not for use in children <12 months or >20 months of age

Dosage form specific issues:

- Latex: Packaging may contain natural latex rubber.
- Thimerosal: Products may contain thimerosal.

Appropriate use:

- TriHIBit® combination: TriHIBit® is Tripedia® vaccine used to reconstitute ActHIB® (*Haemophilus* b conjugate) vaccine. The combination can be used for the DTaP dose given at 15-18 months when Tripedia® was used for the initial doses and a primary series of HIB vaccine has been given. It should not be used for primary immunization.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Refer to individual agents. When administered as the combination formed with TriHIBit®, adverse reactions were less than those seen with ActHIB® and Tripedia® administered separately.

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [preservative free]:

TriHIBit®: Diphtheria 6.7 Lf units, tetanus 5 Lf units, acellular pertussis antigens [inactivated pertussis toxin 23.4 mcg, filamentous hemagglutinin 23.4 mcg], and *Haemophilus* b capsular polysaccharide 10 mcg [bound to tetanus toxoid 24 mcg] per 0.5 mL (0.5 mL) [contains aluminum, natural rubber/natural latex in packaging, polysorbate 80, sucrose, and trace amounts of thimerosal; Tripedia® vaccine used to reconstitute ActHIB® forms TriHIBit®]

Jump To Field (Select Field Name)

Pronunciation(dif THEER ee a & TET a nus TOKS oyds, ay CEL yoo lar per TUS sis & POE lee oh VYE rus vak SEEN)

U.S. Brand NamesKinrix™

Pharmacologic Category[Vaccine, Inactivated (Bacterial)](); [Vaccine, Inactivated (Viral)]()

Use: Labeled IndicationsActive immunization against diphtheria, tetanus, pertussis, and poliomyelitis, used as the 5th dose in the DTaP series and the 4th dose in the IPV series

The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination for use as the fifth dose in the DTaP series and the fourth dose in the IPV series in children who received DTaP (Infanrix®) and/or DTaP-Hepatitis B-IPV (Pediarix®) as the first 3 doses and DTaP (Infanrix®) as the fourth dose. Whenever feasible, the same manufacturer should be used to provide the pertussis component; however, vaccination should not be deferred if a specific brand is not known or is not available.

Dosing: Pediatric**Immunization:** I.M.: Children 4-6 years: 0.5 mL; **Note:** For use as the 5th dose in the DTaP series and the 4th dose in the IPV series

Administration: I.M.For I.M. use only; do not administer intradermally, I.V., or SubQ. Shake well prior to use; do not use unless a homogeneous, turbid, white suspension forms. Administer in the deltoid muscle of the upper arm. Do not administer additional vaccines or immunoglobulins at the same site, or using the same syringe.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Acetaminophen or other appropriate antipyretic should be administered every 4 hours for 24 hours following vaccination to children with history of seizure with DTaP vaccination to decrease the possibility of postvaccination fever.

Administration with other vaccines:

DTaP-IPV with other inactivated vaccines: May be given simultaneously or at any interval between doses.

DTaP-IPV with live vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: DTaP-IPV may be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore under refrigeration of 2°C to 8°C (36°F to 46°F); do not freeze. Discard if frozen.

CompatibilityDo not mix with other vaccines or injections.

ContraindicationsHypersensitivity to diphtheria and tetanus toxoids, pertussis, poliovirus vaccine, or any component of the vaccine; encephalopathy occurring within 7 days of a previous pertussis vaccine not (not attributable to another identifiable cause); progressive neurologic disorders (including infantile spasms, uncontrolled epilepsy, or progressive encephalopathy)

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.
- Reactions from previous pertussis vaccination: Carefully consider use in patients with history of any of the following effects from previous administration of whole-cell DTP or acellular pertussis vaccine: Fever 40.5°C (≥105°F) within 48 hours of unknown cause; seizures with or without fever occurring within 3 days; persistent, inconsolable crying episodes lasting ≥3 hours and occurring within 48 hours; shock or collapse (hypotonic-hyporesponsive episode [HHE]) occurring within 48 hours.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).
- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.
- Guillain-Barré syndrome: Use with caution if Guillain-Barré syndrome occurred within 6 weeks of prior tetanus toxoid.
- Neurologic disorders: Use with caution in patients with history of seizure disorder, progressive neurologic disease, or conditions

predisposing to seizures; ACIP and AAP guidelines recommend deferring immunization until health status can be assessed and condition stabilized. Antipyretics should be administered at the time of and for 24 hours following vaccination to patients at high risk for seizures.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Adults: Safety and efficacy have not been established for use in adults.

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy [including high-dose corticosteroids]); may have a reduced response to vaccination.

- Pediatrics: Safety and efficacy have not been established for use in children <4 years of age and children ≥7 years of age. If inadvertently administered to children ≥7 years of age earlier than the fifth dose in the series, it may be counted as a valid dose, provided the minimum interval requirements were met.

Dosage form specific issues:

- Aluminum: Product may contain aluminum.

- Latex: Packaging may contain natural latex rubber.

- Neomycin: Product may contain neomycin.

- Polymyxin B: Product may contain polymyxin B.

- Polysorbate 80: Product may contain polysorbate 80.

Geriatric ConsiderationsSince protective tetanus and diphtheria antibodies decline with age, only 28% of persons >70 years of age in the U.S. are believed to be immune to tetanus, and most of the tetanus-induced deaths occur in people >60 years of age, it is advisable to offer Td, especially to elderly, concurrent with their influenza and other immunization programs if history of vaccination is unclear; boosters should be given at 10-year intervals; earlier for wounds. For the elderly who cannot document a primary immunization series or at risk due to contact or travel, administer the initial series. Boosters may be necessary for travel since antibody titers may diminish with age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted; not indicated for women of childbearing age.

Breast-Feeding ConsiderationsNot indicated for use by patients ≥7 years of age

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Adverse events reported within 4 days of vaccination:

>10%:

Central nervous system: Drowsiness (19%, grade 3: 1%), fever (≥99.5°F: 16%, >100.4: 7%, >104: <1%)

Gastrointestinal: Loss of appetite (16%; grade 3: 1%)

Local: Injection site: Pain (57%; grade 3: 2%), redness (37%; ≥50 mm: 18%, ≥110 mm: 3%), arm circumference increase (36%, >20 mm: 7%, >30 mm: 2%), swelling (26%; ≥50 mm: 10%, ≥110 mm: 1%)

<1%, postmarketing, and/or case reports: Cellulitis, cerebrovascular accident, constipation, dehydration, gastroenteritis, hypernatremia, injection site vesicles, pruritus

Additional postmarketing events associated with Infanrix®: Allergic reactions, anaphylactoid reactions, anaphylaxis, angioedema, apnea, hypotonic-hyporesponsive episode, lymphadenopathy, seizures, thrombocytopenia, urticaria

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringEvaluate patient's prior immunization history, current state of health, and appropriateness for vaccination prior to therapy (deferring treatment should be considered in presence of acute illness or fever). Treatment for anaphylactic reactions should be immediately available during vaccine use. For I.M. use only; see Administration for specifics. All serious adverse reactions must be reported to the U.S. DHHS. Date of administration, name of manufacturer, lot number, and administering person's name, title, and address should be recorded in patient's permanent medical record. Teach patient/caregiver possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationNotify prescriber immediately of any acute reaction to vaccination (eg, difficulty breathing or swallowing, chest pain or palpitations, acute headache, rash, seizures, high fever). Follow directions for care of injection site; report persistent redness, swelling, or signs of infection at injection site. May cause drowsiness or loss of appetite; if these persist beyond 1-2 days or become severe, consult prescriber.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [preservative free]:

Kinrix™: Diphtheria toxoid 25 Lf, tetanus toxoid 10 Lf, PT 25 mcg, FHA 25 mcg, pertactin 8 mcg, poliovirus type 1 40 DU, poliovirus type 2 8 DU, and poliovirus type 3 32 DU per 0.5 mL (0.5 mL) [contains aluminum, neomycin sulfate, polymyxin B, polysorbate 80, natural rubber/natural latex in packaging]

Generic AvailableNo

ManufacturerGlaxoSmithKline Biologicals

Mechanism of ActionPromotes active immunity to diphtheria, tetanus, pertussis, and poliovirus (types 1, 2 and 3) by inducing production of specific antibodies and antitoxins.

Pharmacodynamics/KineticsOnset of action: Immune response observed to all components ~1 month following vaccination

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsFederal law requires that the date of administration, name of the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Contains the following three pertussis antigens: Inactivated pertussis toxin (PT), filamentous hemagglutinin (FHA), and pertactin. Contains the same diphtheria, tetanus toxoids, and pertussis antigens found in Infanrix® and Pediarix®. Contains the same poliovirus antigens found in Infanrix®.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsDiphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed, and Inactivated Poliovirus Vaccine Combined; Diphtheria, Tetanus Toxoids, Acellular Pertussis (DTaP); DTaP-IPV; Poliovirus, inactivated (IPV)

Pronunciation(dif THEER ee a & TET a nus TOKS oyds ay CEL yoo lar per TUS sis POE lee oh VYE rus & hem OF fi lus in floo EN za bee KON joo gate vak SEEN)
U.S. Brand NamesPentacel®
Pharmacologic CategoryVaccine, Inactivated (Bacterial); Vaccine, Inactivated (Viral)
Use: Labeled IndicationsActive immunization against diphtheria, tetanus, pertussis, poliomyelitis, and invasive disease caused by *H. influenzae* type b in children 6 weeks through 4 years of age

Advisory Committee on Immunization Practices (ACIP) recommends that Pentacel® (DTaP-IPV/Hib) may be used to provide the recommended DTaP, IPV, and Hib immunization in children <5 years of age. Whenever feasible, the same manufacturer should be used to provide the pertussis component; however, vaccination should not be deferred if a specific brand is not known or is not available. The Hib component in Pentacel® contains a tetanus toxoid conjugate. A Hib vaccine containing the PRP-OMP conjugate (PedvaxHIB®) may provide a more rapid seroconversion following the first dose and may be preferable to use in certain populations (eg, American Indian or Alaska Native children).

Dosing: PediatricPrimary immunization: Children 6 weeks to ≤4 years: I.M.: 0.5 mL per dose administered at 2, 4, 6 and 15-18 months of age (total of 4 doses). The first dose may be administered as early as 6 weeks of age. Following completion of the 4-dose series, children should receive a dose of DTaP vaccine at 4-6 years of age (Daptacel® recommended due to same pertussis antigen used in both products).

Children previously vaccinated with ≥1 dose of Daptacel® or IPV vaccines: Pentacel® may be used to complete the first 4 doses of the DTaP or IPV series in children scheduled to receive the other components in the vaccine.

Children previously vaccinated with ≥1 dose of *Haemophilus* b Conjugate vaccine: Pentacel® may be used to complete the series in children scheduled to receive the other components in the vaccine; however, if different brands of *Haemophilus* b Conjugate vaccine are administered to complete the series, 3 primary immunizing doses are needed, followed by a booster dose.

Note: Completion of 3 doses of Pentacel® provides primary immunization against diphtheria, tetanus, *H. influenzae* type B, and poliomyelitis. Completion of the 4-dose series with Pentacel® provides primary immunization against pertussis. It also provides a booster vaccination against diphtheria, tetanus, *H. influenzae* type B, and poliomyelitis.

Administration: I.M.For I.M. administration only. Do not administer I.V. or SubQ. Administer in the anterolateral aspect of thigh in children <1 year of age or deltoid muscle of upper arm in older children. Do not administer to gluteal area or areas near a major nerve trunk. Do not administer additional vaccines or immunoglobulins at the same site or using the same syringe.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends: "It should be administered intramuscularly if, in the opinion of the physician familiar with the patient's bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23-gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection."

Acetaminophen or other appropriate antipyretic should be administered every 4 hours for 24 hours following vaccination to children with history of seizure with DTaP vaccination to decrease the possibility of postvaccination fever.

Administration with other vaccines:

DTaP-IPV/Hib with live vaccines: May be given simultaneously or at any interval between doses.

DTaP-IPV/Hib with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: DTaP-IPV/Hib may be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore at 2°C to 8°C (35°F to 46°F). Do not freeze; discard if product has been frozen. Use immediately after reconstitution.
ReconstitutionGently shake vial containing DTaP-IPV component. Withdraw liquid contents and inject into vial containing Hib powder; shake until uniform suspension results.
ContraindicationsSevere allergic reaction to any vaccine containing diphtheria toxoid, tetanus toxoid, pertussis, poliovirus, or *Haemophilus* b, or any component of this vaccine; encephalopathy occurring within 7 days of a previous pertussis vaccine not (not attributable to another identifiable cause); progressive neurologic disorders (including infantile spasms, uncontrolled epilepsy, or progressive encephalopathy)
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

- Reactions from previous pertussis vaccine: Carefully consider use in patients with history of any of the following effects from previous administration of a pertussis-containing vaccine: Fever ≥105°F (40.5°C) within 48 hours of unknown cause; seizures with or without fever occurring within 3 days; persistent, inconsolable crying episodes lasting ≥3 hours and occurring within 48 hours; shock or collapse (hypotonic-hyporesponsive episode [HHE]) occurring within 48 hours.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

- Guillain-Barré syndrome: Use with caution if Guillain-Barré syndrome occurred within 6 weeks of prior tetanus toxoid.

- Neurologic disorders: Use with caution in patients with history of seizure disorder, progressive neurologic disease, or conditions predisposing to seizures; ACIP and AAP guidelines recommend deferring immunization until health status can be assessed and condition stabilized. Antipyretics should be administered at the time of and for 24 hours following vaccination to patients at high risk for seizures.

Special populations:

- Adults: Safety and efficacy have not been established in adults.

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high-dose corticosteroids); may have a reduced response to vaccination.

- Pediatrics: Safety and efficacy have not been established in children <6 weeks or ≥5 years of age. If inadvertently administered to children ≥5 years as a booster dose, it may be counted as a valid dose.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted for this combination product. This product is not indicated for use in women of childbearing age.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

>10%:

Central nervous system: Fussiness/irritability (54% to 77%; >3 hours 4% to 5%), crying inconsolable crying (36% to 60%; >3 hours ≤2%), lethargy/decreased activity (24% to 46%; severe ≤3%), fever ≥38°C (6% to 16%)

Local: Injection site reactions: Tenderness (39% to 56%; severe 1% to 5%), arm circumference increase >5 mm (34%; >40 mm <1%), redness >5 mm (7% to 17%)

1% to 10%: Local: Injection site reaction: Swelling >5 mm (5% to 10%)

<1%, postmarketing, and/or case reports: Apnea, appetite decreased, asthma, bronchiolitis, consciousness decreased, cough, cyanosis, dehydration, diarrhea, encephalopathy, erythema, gastroenteritis, hypersensitivity reactions, hypotonia, hypotonic-hyporesponsive episodes, injection site reactions (abscess, extensive swelling of injected limb, inflammation, mass), pallor, pneumonia, screaming, seizure, skin discoloration, somnolence, vomiting

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension:

Pentacel®: Diphtheria toxoid 15 Lf, tetanus toxoid 5 Lf, acellular pertussis antigens (pertussis toxin detoxified 20 mcg, filamentous hemagglutinin 20 mcg, pertactin 3 mcg, fimbriae [types 2 and 3] 5 mcg), poliovirus (type 1: 40 D-antigen units; type 2: 8 D antigen units; type 3: 32 D antigen units), and *Haemophilus* b capsular polysaccharide 10 mcg (bound to tetanus toxoid 24 mcg) per 0.5 mL (0.5 mL) [contains albumin, aluminum, neomycin, polymyxin B sulfate, and polysorbate 80; supplied in two vials, one containing DTaP-IPV liquid and one containing Hib powder]

Diphtheria and Tetanus Toxoids

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(dif THEER ee a & TET a nus TOKS oyds)

U.S. Brand NamesDecavac®

Canadian Brand NamesTd Adsorbed

Pharmacologic CategoryVaccine, Inactivated (Bacterial)

Use: Labeled Indications

Diphtheria and tetanus toxoids adsorbed for pediatric use (DT): Infants and children through 6 years of age: Active immunization against diphtheria and tetanus when pertussis vaccine is contraindicated

Tetanus and diphtheria toxoids adsorbed for adult use (Td) (Decavac™): Children ≥7 years of age and Adults: Active immunization against diphtheria and tetanus; tetanus prophylaxis in wound management

The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination for the following:

- Adults and children ≥7 years should receive a booster dose of Td every 10 years; persons <65 years of age may substitute a single Td booster dose with Tdap
- Children 7-10 years, adults, and the elderly (≥65 years) who are wounded in bombings or similar mass casualty events who have penetrating injuries or nonintact skin exposure and who cannot confirm receipt of a tetanus booster within the previous 5 years, may also receive a single dose of Td; children ≥11 years may also received Td if Tdap is unavailable

Dosing: Adults

Primary immunization: I.M.: Patients previously not immunized should receive 2 primary doses of 0.5 mL each, given at an interval of 4-6 weeks; third (reinforcing) dose of 0.5 mL 6-12 months later

Booster immunization: I.M.: 0.5 mL every 10 years; to be given to children 11-12 years of age if at least 5 years have elapsed since last dose of toxoid containing vaccine. Subsequent routine doses are not recommended more often than every 10 years.

Tetanus prophylaxis in wound management; use of tetanus toxoid (Td) and/or tetanus immune globulin (TIG) depends upon the number of prior tetanus toxoid doses and type of wound: I.M.: See table.

Tetanus Prophylaxis in Wound Management

Number of Prior Tetanus Toxoid Doses	**Clean, Minor Wounds**		**All Other Wounds**	
	Td[1]	**TIG**[2]	**Td**[1]	**TIG**[2]
Unknown or <3	Yes	No	Yes	Yes
≥3[3]	No[4]	No	No[5]	No
[1]Adult tetanus and diphtheria toxoids; use pediatric preparations (DT or DTP) if the patient is <7 years old.				
[2]Tetanus immune globulin.				
[3]If only three doses of fluid tetanus toxoid have been received, a fourth dose of toxoid, preferably an adsorbed toxoid, should be given.				
[4]Yes, if >10 years since last dose.				
[5]Yes, if >5 years since last dose.				
Adapted from Centers for Disease Control, “Diphtheria, Tetanus, and Pertussis: Recommendations for Vaccine Use and Other Preventive Measures: Recommendations				

of the Immunization Practices Advisory Committee (ACIP)," *MMWR* 1991:40(RR-10).

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Primary immunization: I.M.:

Infants and Children ≤6 years (DT):

6 weeks to 1 year: Three 0.5 mL doses at least 4 weeks apart; administer a reinforcing dose 6-12 months after the third injection

1-6 years: Two 0.5 mL doses at least 4-8 weeks apart; reinforcing dose 6-12 months after second injection; if final dose is given after seventh birthday, use adult preparation

4-6 years (booster immunization): 0.5 mL; not necessary if the fourth dose was given after fourth birthday; routinely administer booster doses at 10-year intervals with the adult preparation

Children ≥7 years: Refer to adult dosing. The ACIP prefers Tdap for use in adolescents 11-18 years; refer to Diphtheria and Tetanus Toxoids and Acellular Pertussis Vaccine monograph for additional information.

Tetanus prophylaxis in wound management: Children ≥7 years: Use of tetanus toxoid (Td) and/or tetanus immune globulin (TIG) depends upon the number of prior tetanus toxoid doses and type of wound: See table.

Administration: I.M.Prior to use, shake suspension well

Td: Administer in the deltoid muscle; do not inject in the gluteal area

DT: Administer in the anterolateral aspect of the thigh or the deltoid muscle; do not inject in the gluteal area

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends "it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection."

Administration with other vaccines:

Diphtheria and Tetanus Toxoids vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Diphtheria and Tetanus Toxoids vaccine with live vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: Diphtheria and tetanus toxoids vaccine may be given simultaneously at different sites or at any interval between doses. Examples of antibody containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore at 2°C to 8°C (35°F to 46°F). Do not freeze. Discard if product has been frozen.

ContraindicationsHypersensitivity to diphtheria, tetanus toxoid, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.
- Arthus-type hypersensitivity: Td or Tdap vaccines and emergency doses of Td vaccine should not be given more frequently than every 10 years in patients who have experienced a serious Arthus-type hypersensitivity reaction following a prior use of tetanus toxoid.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).
- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.
- Guillain-Barré syndrome: Continue use with caution if Guillain-Barré syndrome occurs within 6 weeks of prior tetanus toxoid.
- Poliomyelitis: Defer administration during outbreaks of poliomyelitis.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Adults: Td should be administered adults.
- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.

- Pediatrics: Safety and efficacy of DT have not been established in children <6 weeks of age; Td should be administered to children ≥7 years of age.

Dosage form specific issues:

- DT confused with Td: Do not confuse pediatric diphtheria and tetanus (DT) with adult tetanus and diphtheria (Td).
- Latex: Some products may contain natural latex/natural rubber.
- Thimerosal: Some products may contain thimerosal.

Geriatric ConsiderationsSince protective tetanus and diphtheria antibodies decline with age, only 28% of persons >70 years of age in the U.S. are believed to be immune to tetanus, and most of the tetanus-induced deaths occur in people >60 years of age, it is advisable to offer Td, especially to elderly, concurrent with their influenza and other immunization programs if history of vaccination is unclear; boosters should be given at 10-year intervals; earlier for wounds.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. DT is not recommended for use in persons ≥7 years of age. The Advisory Committee on Immunization Practices (ACIP) recommends booster injections for previously vaccinated pregnant women who have not had Td vaccination within the past 10 years. Pregnant women who are not immunized or are only partially immunized should complete the primary series. Vaccination may be deferred until the postpartum period in women who are likely to have sufficient diphtheria and tetanus protection until delivery; Tdap may be substituted for Td after delivery to add extra protection against pertussis. Td should be administered during pregnancy to women who do not have sufficient tetanus immunity to protect against maternal and neonatal tetanus, and if booster protection for diphtheria is required (eg, travel to where diphtheria is endemic). Tetanus immune globulin and a tetanus toxoid containing vaccine are recommended by the ACIP as part of the standard wound management to prevent tetanus in pregnant women; the use of Td during pregnancy is recommended for wound management if ≥5 years have passed since the last Td vaccination.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

>10%: Local: Injection site (adolescents and adults): Pain (81% to 85%), redness (5% to 21%), swelling (10% to 16%)

Frequency not defined; reactions reported with adult and pediatric preparations

Cardiovascular: EEG disturbances

Central nervous system: Brachial neuritis, dizziness, Guillain-Barré syndrome, paresthesia, seizure

Dermatologic: Rash

Gastrointestinal: Nausea, vomiting

Local: Injection site: Persistent nodules; local reactions (erythema, cellulitis, swelling)

Neuromuscular & skeletal: Arthralgia, myalgia

Miscellaneous: Allergic/anaphylactic reactions, Arthus-type hypersensitivity reaction (severe local reaction starting 2-8 hours after injection)

Note: Other neurological conditions reported in temporal association with vaccine administration have not been demonstrated to be causally related to the vaccine. These have included demyelinating CNS diseases, mononeuropathies, and encephalopathy.

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [Td, adult]: Diphtheria 2 Lf units and tetanus 2 Lf units per 0.5 mL (5 mL, 7.5 mL); Diphtheria 2 Lf units and tetanus 5 Lf units per 0.5 mL (5 mL, 7.5 mL)

Injection, suspension [Td, adult; preservative free]: Diphtheria 2 Lf units and tetanus 2 Lf units per 0.5 mL (0.5 mL); diphtheria 2 Lf units and tetanus 5 Lf units per 0.5 mL (0.5 mL)

Decavac®: Diphtheria 2 Lf units and tetanus 5 Lf units per 0.5 mL (0.5 mL) [contains aluminum, thimerosal (may have trace amounts)]

Injection, suspension [Dt, pediatric; preservative free]: Diphtheria 6.7 Lf units and tetanus 5 Lf units per 0.5 mL (0.5 mL)

Generic AvailableYes

Diphtheria Antitoxin

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(dif THEER ee a an tee TOKS in)
Pharmacologic CategoryAntitoxin
Use: Labeled IndicationsTreatment of diphtheria (neutralizes unbound toxin, available from CDC)
Dosing: AdultsDiphtheria treatment: I.M. or slow I.V. infusion: Dosage varies; range: 20,000-120,000 units
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Restrictions

Diphtheria antitoxin is not currently licensed by the Food and Drug Administration (FDA) and is only available in the U.S. under an investigational new drug (IND) protocol through the Centers for Disease Control and Prevention (CDC). Physicians may contact the CDC Drug Service at 404-639-3670 (Monday-Friday 8:00 a.m. to 4:30 p.m. eastern/standard time) or by contacting the CDC Emergency Operations Center at 770-488-7100. Additional information may be found at http://www.cdc.gov/vaccines/vpd-vac/diphtheria/dat/dat-main.htm

Pregnancy Risk FactorD
Drug InteractionsThere are no known significant interactions.
Generic AvailableNo
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Diphtheria, Tetanus Toxoids, Acellular Pertussis, Hepatitis B (Recombinant), and Poliovirus Vaccine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(dif THEER ee a, TET a nus TOKS oyds, ay CEL yoo lar per TUS sis, hep a TYE tis bee, & POE lee oh VYE rus, in ak ti VAY ted vak SEEN)
U.S. Brand NamesPediarix®
Canadian Brand NamesPediarix®
Pharmacologic CategoryVaccine, Inactivated (Bacterial); Vaccine, Inactivated (Viral)
Use: Labeled IndicationsCombination vaccine for the active immunization against diphtheria, tetanus, pertussis, hepatitis B virus (all known subtypes), and poliomyelitis (caused by poliovirus types 1, 2, and 3)

The Advisory Committee on Immunization Practices (ACIP) recommends Pediarix® for the following:

- Primary vaccination for DTaP, Hep B, and IPV in children at 2-, 4-, and 6 months of age.

- To complete the primary vaccination series in children who have received DTaP (Infanrix®) and who are scheduled to received the other components of the vaccine. Whenever feasible, the same manufacturer should be used to provide the pertussis component; however, vaccination should not be deferred if a specific brand is not known or is not available. HepB and IPV from different manufacturers are interchangeable.

Dosing: Pediatric

Primary immunization: Children 6 weeks to <7 years: I.M.: 0.5 mL; repeat in 6-8 week intervals (preferably 8-week intervals) for a total of 3 doses. Vaccination usually begins at 2 months, but may be started as early as 6 weeks of age.

Use in children previously vaccinated with one or more component, and who are also scheduled to receive all vaccine components:

Hepatitis B vaccine: Infants born of HBsAg-negative mothers who received 1 dose of hepatitis B vaccine at birth may be given Pediarix® (safety data limited); use in infants who received more than 1 dose of hepatitis B vaccine has not been studied. Infants who received 1 or more doses of hepatitis B vaccine (recombinant) may be given Pediarix® to complete the hepatitis B series (safety and efficacy not established).

Diphtheria and tetanus toxoids, and acellular pertussis vaccine (DTaP): Infants previously vaccinated with 1 or 2 doses of Infanrix® may use Pediarix® to complete the first 3 doses of the series (safety and efficacy not established); use of Pediarix® to complete DTaP vaccination started with products other than Infanrix® is not recommended.

Inactivated polio vaccine (IPV): Infants previously vaccinated with 1 or 2 doses of IPV may use Pediarix® to complete the first 3 doses of the series (safety and efficacy not established).

Administration: I.M.For I.M. use only; do not administer I.V. or SubQ. Shake well prior to use; do not use unless a homogeneous, turbid, white suspension forms. Administer in the anterolateral aspects of the thigh or the deltoid muscle of the upper arm. Do not inject in the gluteal area (suboptimal hepatitis B immune response) or where there may be a major nerve trunk. Do not administer additional vaccines or immunoglobulins at the same site, or using the same syringe.

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends “it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection.”

Administration with other vaccines:

DTaP/IPV/HepB with live vaccines: May be given simultaneously or at any interval between doses.

DTaP/IPV/HepB with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Vaccine administration with antibody-containing products: DTaP/IPV/HepB may be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

StorageStore under refrigeration of 2°C to 8°C (36°F to 46°F); do not freeze. Discard if frozen.
CompatibilityDo not mix with other vaccines or injections.
ContraindicationsHypersensitivity to diphtheria and tetanus toxoids, pertussis, hepatitis B, poliovirus vaccine, or any component of the vaccine; encephalopathy occurring within 7 days of a previous pertussis vaccine not (not attributable to another identifiable cause); progressive neurologic disorders (including infantile spasms, uncontrolled epilepsy, or progressive encephalopathy)
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

- Reactions from previous pertussis vaccine: Carefully consider use in patients with history of any of the following effects from previous administration of whole-cell DTP or acellular pertussis vaccine: Fever ≥105°F (40.5°C) within 48 hours of unknown cause; seizures with or without fever occurring within 3 days; persistent, inconsolable crying episodes lasting ≥3 hours and occurring within 48 hours; shock or collapse (hypotonic-hyporesponsive episode [HHE]) occurring within 48 hours.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.

- Guillain-Barré syndrome: Use with caution if Guillain-Barré syndrome occurred within 6 weeks of prior tetanus toxoid.

- Neurologic disorders: Use with caution in patients with history of seizure disorder, progressive neurologic disease, or conditions predisposing to seizures; ACIP and AAP guidelines recommend deferring immunization until health status can be assessed and condition stabilized. Antipyretics should be administered at the time of and for 24 hours following vaccination to patients at high risk for seizures.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Adults: Safety and efficacy have not been established for use in adults.

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy [including high-dose corticosteroids]); may have a reduced response to vaccination.

- Pediatrics: Safety and efficacy have not been established for use in children <6 weeks and children ≥7 years of age. Infants born of HBsAg-positive mothers should receive monovalent hepatitis B vaccine and hepatitis B immune globulin; infants born of HBsAg-unknown mothers should receive monovalent hepatitis B vaccine; use of combination product in these patients to complete the hepatitis B vaccination series has not been studied but is considered acceptable by the ACIP.

Dosage form specific issues:

- Aluminum: Product may contain aluminum.

- Latex: Packaging may contain natural latex rubber.

- Neomycin: Product may contain neomycin.

- Polymyxin B: Product may contain polymyxin B.

- Polysorbate 80: Product may contain polysorbate 80.

- Yeast protein: Product may contain yeast protein.

Other warnings/precautions:

- Booster dose: Not for use as a booster dose following the 3-dose primary series.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted; not indicated for women of childbearing age.
Breast-Feeding ConsiderationsNot indicated for women of childbearing age.
Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Adverse events reported within 4 days of vaccination at 2-, 4-, and 6 months of age in patients given Pediarix® concomitantly with Hib conjugate vaccine and PCV7 vaccine.

>10%:

Central nervous system: Central nervous system: Irritability/fussiness (61% to 65%; grade 3: 3% to 4%), drowsiness (41% to 57%), fever ≥100.4°F (28% to 39%)

Gastrointestinal: Loss of appetite (26% to 31%; grade 3: <1%)

Local: Injection site: Redness (25% to 40%; >20 mm: 2% to 3%), pain (31% to 36%; grade 3: 2% to 3%), swelling (17% to 29%; >20 mm: 2% to 3%)

1% to 10%: Central nervous system: Fever >103.1°F (<1%)

Additional and postmarketing events: Anaphylactic/anaphylactoid reaction, angioedema, anorexia, apnea, arthus-type hypersensitivity reactions, brachial neuritis, bronchitis, bulging fontanelle, consciousness depressed, cranial mononeuropathy, crying, cyanosis, demyelinating disease, dermatitis, diarrhea, dyspnea, erythema, fatigue, febrile convulsion, Guillain-Barré syndrome, hypersensitivity reaction, hypotonia, hypotonic-hyporesposnive episode, injection site reactions (cellulitis, induration, itching, nodule, warmth), insomnia, lethargy, limb pain, limb swelling, liver function test abnormalities, nervousness, pallor, peripheral mononeuropathy, petechiae, rash, restlessness, screaming, seizure, SIDS, somnolence, upper respiratory tract infection, urticaria, vomiting

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringChildren who are moderately to severely ill (with or without fever) should not get this vaccination until they have recovered. Assess any hypersensitivity history prior to administering. Treatment for anaphylactic/anaphylactoid reaction should be available during vaccine use. See Contraindications, Warnings/Precautions, Dosing, and Administration for specific use cautions. Before administering, see Drug Interactions. Antipyretics should be administered at time of and for 24 hours following vaccination to patients at high-risk for seizures. **Note:** All serious adverse reactions must be reported the the US DHHS (see Adverse Reactions). Record date of administration, name of manufacturer, lot number, and administering person's name, title, and address into patient's permanent medical record. Teach caregiver possible side effects/appropriate interventions, and adverse symptoms to report (see Patient Education). **Pregnancy risk factor C** - not for women of childbearing age.

Patient EducationChildren who are moderately to severely ill (with or without fever) should not get this vaccination until they have recovered. Inform prescriber of all previous allergic reactions and any other medications being used. Three doses will be required for effective immunity; consult prescriber for appropriate schedule of vaccinations. May cause increased sleeping, restlessness, fussiness, decreased appetite, or fever (use antipyretic if directed by prescriber, or consult prescriber for appropriate antipyretic). May cause some redness, pain, or swelling at injection site; consult prescriber if excessive or persistent. Notify prescriber immediately of any excessive or persistent reactions (eg, fever >105°F within 48 hours, inconsolable crying that occurs within 48 hours and lasts 3 hours, seizures that occur within 3 days).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [preservative free]:

Pediarix®: Diphtheria toxoid 25 Lf, tetanus toxoid 10 Lf, acellular pertussis antigens [inactivated pertussis toxin 25 mcg, filamentous hemagglutin 25 mcg, pertactin 8 mcg, HBsAg 10 mcg, type 1 poliovirus 40 D antigen units, type 2 poliovirus 8 D antigen units and type 3 poliovirus 32 D antigen units] per 0.5 mL (0.5 mL) [contains aluminum, neomycin sulfate (trace amounts), polymyxin B (trace amounts), polysorbate 80, and yeast protein ≤5%; prefilled syringes contain natural rubber/natural latex]

Generic AvailableNo

ManufacturerGlaxoSmithKline Biologicals

Mechanism of ActionPromotes active immunity to diphtheria, tetanus, pertussis, hepatitis B and poliovirus (types 1, 2 and 3) by inducing production of specific antibodies and antitoxins.

Pharmacodynamics/KineticsOnset of action: Immune response observed to all components 1 month following the 3-dose series

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsFederal law requires that the date of administration, name of the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Contains the following three pertussis antigens: Inactivated pertussis toxin (PT), filamentous hemagglutinin (FHA) and pertactin. Contains the same diphtheria and tetanus toxoids and pertussis antigens found in Infanrix®. Contains the same hepatitis B surface antigen (HBsAg) found in Engerix-B® (recombinant vaccine).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation and restlessness are common

Mental Health: Effects on Psychiatric TreatmentContraindicated in patients with progressive neurologic disorders

Dipivefrin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(dye PI ve frin)

U.S. Brand NamesPropine®

Canadian Brand NamesOphtho-Dipivefrin™; PMS-Dipivefrin; Propine®

Pharmacologic CategoryAlpha/Beta Agonist; Ophthalmic Agent, Antiglaucoma; Ophthalmic Agent, Vasoconstrictor

Use: Labeled IndicationsReduces elevated intraocular pressure in chronic open-angle glaucoma; also used to treat ocular hypertension, low tension, and secondary glaucomas

Dosing: AdultsGlaucoma: Ophthalmic: Instill 1 drop every 12 hours into the eyes

Dosing: ElderlyRefer to adult dosing.

StorageAvoid exposure to light and air. Discolored or darkened solutions indicate loss of potency.

ContraindicationsHypersensitivity to dipivefrin, any component of the formulation, or epinephrine; angle-closure glaucoma

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Hypertension: Use with caution in patients with hypertension.

Special populations:

- Aphakic patients: Use with caution in aphakic patients.

Dosage form specific issues:

- Sodium metabisulfite: Product may contain sodium metabisulfite.

Geriatric ConsiderationsUse with caution in patients with heart disease. Assess patient's ability to self-administer drops.

Pregnancy Risk FactorB

Adverse Reactions

1% to 10%:

Central nervous system: Headache

Local: Burning, stinging

Ocular: Ocular congestion, photophobia, mydriasis, blurred vision, ocular pain, bulbar conjunctival follicles, blepharoconjunctivitis, cystoid macular edema

<1%: Arrhythmias, hypertension

Drug Interactions

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Patient EducationDiscolored solutions should be discarded. May cause transient burning or stinging

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic, as hydrochloride: 0.1% (5 mL, 10 mL, 15 mL) [contains benzalkonium chloride]

Propine®: 0.1% (5 mL [DSC], 10 mL, 15 mL) [contains benzalkonium chloride]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Dipivefrin HCl)

0.1% (5): $13.99

0.1% (10): $15.99

0.1% (15): $19.99

Mechanism of Action Dipivefrin is a prodrug of epinephrine which is the active agent that stimulates alpha- and/or beta-adrenergic receptors increasing aqueous humor outflow

Pharmacodynamics/Kinetics

Ocular pressure effect:

Onset of action: ~30 minutes

Duration: ≥12 hours

Mydriasis:

Onset of action: ~30 minutes

Duration: Several hours

Absorption: Rapid into aqueous humor

Metabolism: Converted to epinephrine

Related Information

- Glaucoma Drug Therapy

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Anesthesia and Critical Care Concerns/Other Considerations Systemic absorption can occur, although minimal.

Index Terms Dipivalyl Epinephrine; Dipivefrin Hydrochloride; DPE

International Brand NamesD Epifrin (DE); D'epifrin (PL); Difrin (IL); Diopine (ES, GR, NL); Diopine-C (MX); Dipoquin (NZ); Glaucothil (AT, DE); Glaudrops (ES); Oftanex (PL); Pivepol (PL); Propine (AE, AU, BE, BH, BR, CY, EG, FI, FR, GB, IE, IL, IN, IQ, IR, IT, JO, KW, LB, LY, NO, OM, PT, QA, SA, SY, TH, TR, TW, YE)

Dipyridamole

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Dipyridamole may be confused with disopyramide

Persantine® may be confused with Periactin®, Permitil®

Pronunciation(dye peer ID a mole)
U.S. Brand NamesPersantine®
Canadian Brand NamesApo-Dipyridamole FC®; Dipyridamole For Injection; Persantine®
Pharmacologic CategoryAntiplatelet Agent; Vasodilator
Use: Labeled Indications

Oral: Used with warfarin to decrease thrombosis in patients after artificial heart valve replacement

I.V.: Diagnostic agent in CAD

Dosing: Adults

Adjunctive therapy for prophylaxis of thromboembolism with cardiac valve replacement: Oral: 75-100 mg 4 times/day

Evaluation of coronary artery disease: I.V.: 0.14 mg/kg/minute for 4 minutes; maximum dose: 60 mg

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Adjunctive therapy for prophylaxis of thromboembolism with cardiac valve replacement: Oral: Children ≥12 years: Refer to adult dosing.

Administration: I.V.I.V.: Infuse diluted solution over 4 minutes; following dipyridamole infusion, inject thallium-201 within 5 minutes. **Note:** Aminophylline should be available for urgent/emergent use; dosing of 50-100 mg (range: 50-250 mg) IVP over 30-60 seconds.
Administration: OralAdminister with water 1 hour before meals.
Dietary ConsiderationsShould be taken with water 1 hour before meals.
StorageI.V.: Store between 15°C to 25°C (59°F to 77°F). Do not freeze, protect from light.
ReconstitutionPrior to administration, dilute solution for injection to a ≥1:2 ratio in NS, $^1/_2$NS, or D$_5$W. Total volume should be ~20-50 mL.
CompatibilityStable in $^1/_2$NS, D$_5$W, NS. Do not mix with other drugs in syringe or infusion container.
Extemporaneously PreparedA 10 mg/mL oral suspension has been made using four 25 mg tablets and purified water USP qs ad to 10 mL; expected stability is 3 days. Dipyridamole 10 mg/mL was stable for up to 60 days at 5°C and 25°C in 1:1 mixtures of Ora-Sweet® and Ora-Plus®, Ora-Sweet® SF and Ora-Plus® and in cherry syrup

Allen LV and Erickson III MA, “Stability of Baclofen, Captopril, Diltiazem, Hydrochloride, Dipyridamole, and Flecainide Acetate in Extemporaneously Compounded Oral Liquids,” *Am J Health Syst Pharm*, 1996, 53:2179-84.

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 2nd ed, Cincinnati, OH: Harvey Whitney Books Co, 1992.

ContraindicationsHypersensitivity to dipyridamole or any component of the formulation
Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with in patients with hypotension, unstable angina, and/or recent MI.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- Antiplatelet agents/anticoagulants: Use with caution in patients on other antiplatelet agents or anticoagulation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Dosage form specific issues:

- Injection: Severe adverse reactions have occurred rarely with I.V. administration. Use the I.V. form with caution in patients with bronchospastic disease or unstable angina. Have aminophylline ready in case of urgency or emergency with I.V. use.

Geriatric ConsiderationsSince evidence suggests that clinically used doses are ineffective for prevention of platelet aggregation, consideration for low-dose aspirin (81-325 mg/day) alone may be necessary. This will decrease cost as well as inconvenience.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsExcretion in breast milk is reported to be minimal.

Adverse Reactions

Oral:

>10%: Dizziness (14%)

1% to 10%:

Central nervous system: Headache (2%)

Dermatologic: Rash (2%)

Gastrointestinal: Abdominal distress (6%)

Frequency not defined: Diarrhea, vomiting, flushing, pruritus, angina pectoris, liver dysfunction

Postmarketing and/or case reports: Alopecia, arthritis, cholelithiasis, dyspepsia, fatigue, hepatitis, hypersensitivity reaction, hypotension, larynx edema, malaise, myalgia, nausea, palpitation, paresthesia, tachycardia, thrombocytopenia

I.V.:

>10%:

Cardiovascular: Exacerbation of angina pectoris (20%)

Central nervous system: Dizziness (12%), headache (12%)

1% to 10%:

Cardiovascular: Hypotension (5%), hypertension (2%), blood pressure lability (2%), ECG abnormalities (ST-T changes, extrasystoles; 5% to 8%), pain (3%), tachycardia (3%)

Central nervous system: Flushing (3%), fatigue (1%)

Gastrointestinal: Nausea (5%)

Neuromuscular & skeletal: Paresthesia (1%)

Respiratory: Dyspnea (3%)

<1% (Limited to important or life-threatening): Abdominal pain, abnormal coordination, appetite increased; arrhythmia (ventricular tachycardia, bradycardia, AV block, SVT, atrial fibrillation, asystole); arthralgia, asthenia, back pain, breast pain, bronchospasm, cardiomyopathy, cough, depersonalization, diaphoresis, dry mouth, dysgeusia, dyspepsia, dysphagia, earache, ECG abnormalities (unspecified), edema, eructation, flatulence, hypertonia, hyperventilation, injection site reaction, intermittent claudication leg cramping, malaise, MI, myalgia, orthostatic hypotension, palpitation, perineal pain, pharyngitis, pleural pain, renal pain, rhinitis, rigor, syncope, tenesmus, thirst, tinnitus, tremor, vertigo, vision abnormalities, vomiting

Postmarketing and/or case reports: Allergic reaction, pruritus, rash, urticaria

Drug Interactions

Adenosine: Dipyridamole may enhance the therapeutic effect of Adenosine. Dose reduction of adenosine may be needed. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Beta-Blockers: Dipyridamole may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Regadenoson: Dipyridamole may enhance the therapeutic effect of Regadenoson. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Topotecan: BCRP/ABCG2 Inhibitors may increase the serum concentration of Topotecan. *Risk D: Consider therapy modification*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, ginseng (all have additional antiplatelet activity).

Monitoring ParametersBlood pressure, heart rate, ECG (stress test)

Nursing: Physical Assessment/MonitoringMonitor therapeutic effectiveness (dependent on purpose for use) and adverse reactions. Observe bleeding precautions. **Oral:** Monitor blood pressure on a regular basis. **I.V.:** Continuous ECG and blood pressure monitoring during infusion. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake tablet exactly as directed, with water 1 hour before meals. You may experience mild headache, transient diarrhea, or temporary dizziness (sit or lie down when taking medication). You may have a tendency to bleed easily; use caution with sharps, needles, or razors. Report chest pain, redness around mouth, acute abdominal cramping or severe diarrhea, acute and persistent headache or dizziness, rash, respiratory difficulty, or swelling of extremities. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 5 mg/mL (2 mL, 10 mL)

Tablet: 25 mg, 50 mg, 75 mg

Persantine®: 25 mg, 50 mg, 75 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Dipyridamole)

25 mg (100): $28.99

Tablets (Persantine)

25 mg (100): $68.18

50 mg (100): $105.79

75 mg (100): $140.14

Mechanism of ActionInhibits the activity of adenosine deaminase and phosphodiesterase, which causes an accumulation of adenosine, adenine nucleotides, and cyclic AMP; these mediators then inhibit platelet aggregation and may cause vasodilation; may also stimulate release of prostacyclin or PGD_2; causes coronary vasodilation

Pharmacodynamics/Kinetics

Absorption: Readily, but variable

Distribution: Adults: V_d: 2-3 L/kg

Protein binding: 91% to 99%

Metabolism: Hepatic

Half-life elimination: Terminal: 10-12 hours
